Network Server Division
10955 Tantau Avenue MS-45SLE
Cupertino, CA 950140770

Audience Assumptions

The guide is for HP authorized service personnel who install, administer, and troubleshoot HP NetServers. The Hewlett-Packard Company assumes you are qualified in the servicing of computer equipment and trained in recognizing hazards in products with hazardous energy levels.

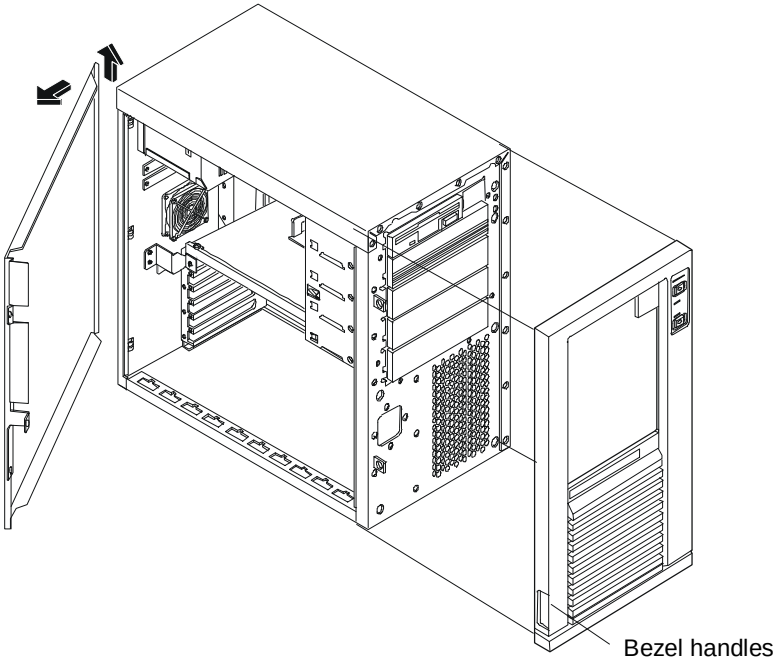
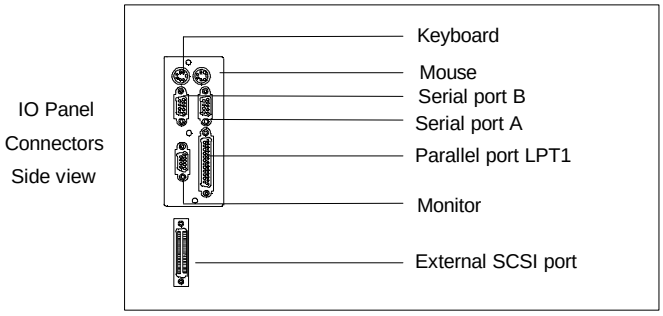
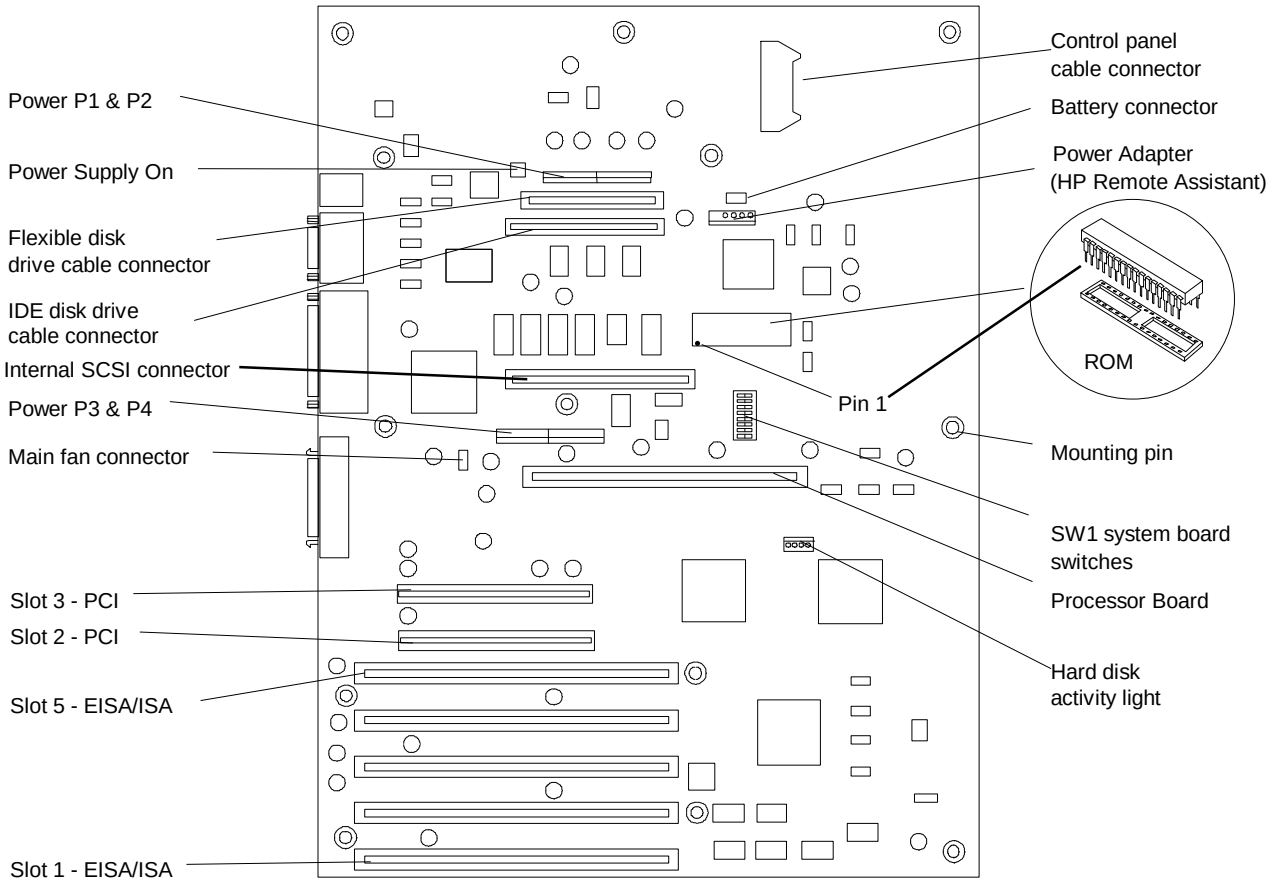
Front Bezel and Cover



System Board





System Board

System Board Connectors, Switches, and Jumpers

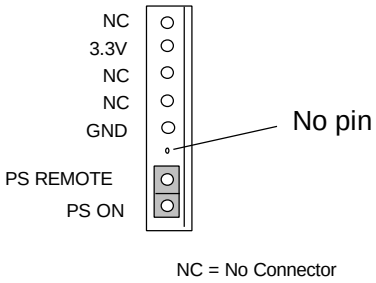
The table below explains the system board markings for all connectors.

Connector	Number	Connector	Number
IDE disk drive cable	J9	Flexible disk drive	J6
Keyboard (bottom)	J4	Mouse (top)	J4
Video	J10	Parallel	J10
Serial	J8	SCSI port A	J11
SCSI port B	J13	EISA/ISA slots	J19, J20, J21, J22, J24
PCI slots	J17, J18	Fan	J14
Power supply	J2 (P1, P2) J12 (P3, P4)	Remote power supply	J7
Battery	J5	Front panel	J1
Processor board slot	J15	ROM	U23
Power supply on	J3	Hard disk activity light	J16
Extra fan (not used)	J23	Not used	J23

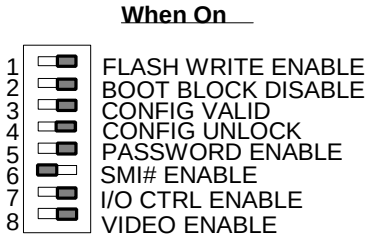
System Board Connector J7

This connector is used by the HP Remote Assistant Accessory -- a 32-bit EISA Bus Master board used to remotely monitor server functionality. For additional information on this product, see the documentation that comes with it. When you install the HP Remote Assistant cable, you will need to remove the jumper on PS REMOTE and PS ON. If you remove HP Remote Assistant from the server, remember to re-install the jumper.

WARNING If the HP Remote Assistant is not installed and there is no jumper on PS REMOTE and PS ON, the system will NOT power up.



SW1 Switch and Default Settings

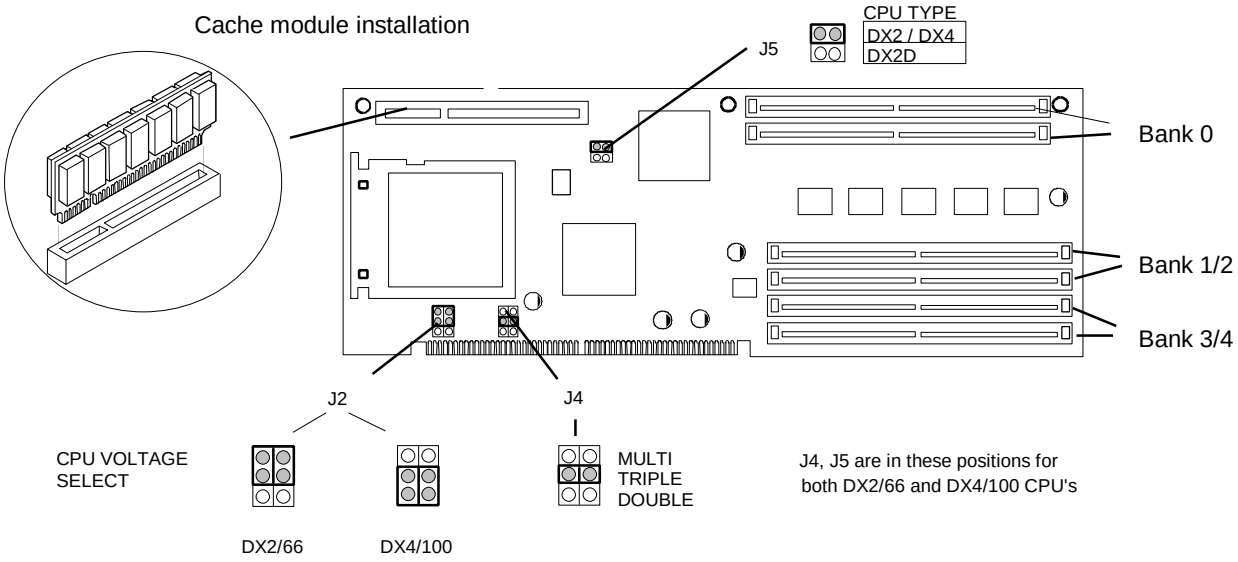


Switch	Function	Default
1	**FLASH WRITE ENABLE:** Enables or disables one of the two levels of flash ROM write protection (the other level of protection is controlled by the HP Update Utility). ON: The BIOS can be updated by the HP Update Utility. OFF: The BIOS is locked and cannot be updated.	ON
2	**BOOT BLOCK DISABLE:** Reserved. Must be set to ON for system to operate properly.	ON
3	**CONFIG VALID**: Saves or erases the current configuration information in NVRAM and CMOS. **ON:** Saves the current configuration. **OFF:** Erases the current system configuration.	ON
4	**CONFIG UNLOCK**: Prevents or allows the current system configuration maintained in NVRAM and CMOS to be changed. **ON**: Unlocked. Allows the current system configuration to be changed. **OFF**: Locked. Prevents the current system configuration from being changed.	ON

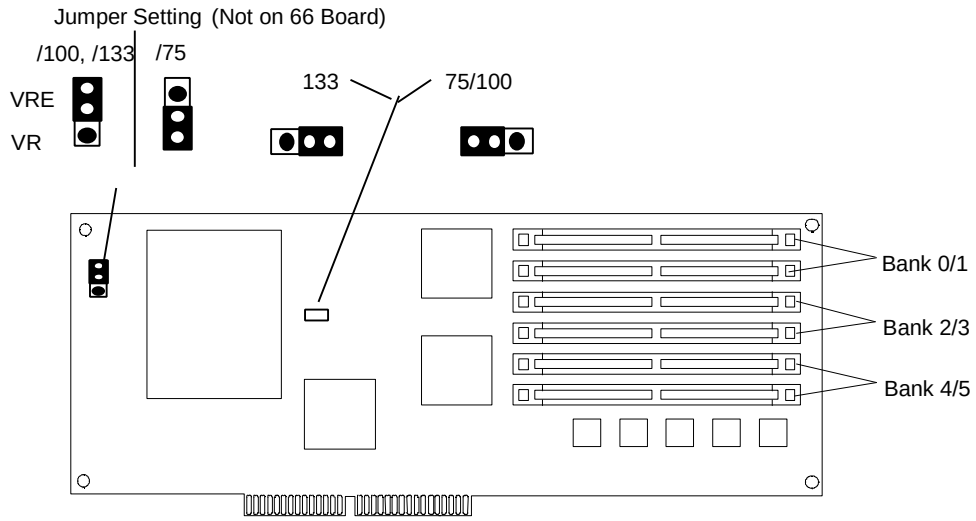
5	**PASSWORD ENABLE**: Enables or erases the power-on password maintained in NVRAM. **ON**: Power-on password functional. **OFF**: Erases the current power-on password.	ON
6	**SMI# ENABLE: Not used - leave in default position** **OFF:** Prevents SMI interrupt.	OFF
7	**IO CTRL ENABLE**: Enables or disables onboard flexible disk drive controller, IDE controller, and serial and parallel ports. **ON**: I/O controller enabled. **OFF**: I/O controller disabled.	ON
8	**VIDEO ENABLE:** Enables or disables built-in video. Disable the built-in video only if you have a separate video board installed in the server. **ON**: Enables built-in video. **OFF**: Disables built-in video.	ON

Processor Boards

Intel 486 Processor Board with Optional 256 KB Cache

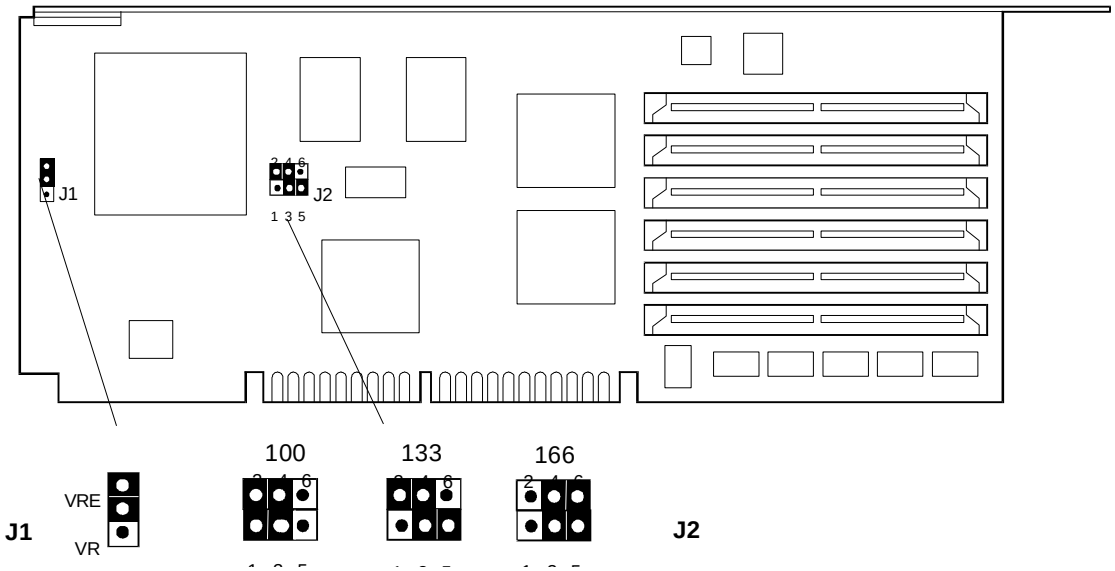


Pentium™ Processor Board



5/100, 5/133, 5/166 Pentium™ Processor Board

Before installing this board, verify that jumper setting J1 is set to VRE and jumper setting J2 is set to the correct speed for your chip as shown in the illustration below.



Memory

The Intel 486 processor board has 8 MB of single-density base memory installed. This memory is not customer removable and **can only be single-density**. There are two banks (four sockets) available for expansion memory that can be single or double density. The maximum memory supported is 136 MB (4 x 32 MB + 8 MB).

The Pentium 66/75 processor has 16 MB of removable base memory installed. The Pentium 100/133 processor has 32 MB of removable base memory installed. There are two more banks (four sockets) available for expansion. The maximum memory supported is 192 MB (6 x 32 MB).

There are some basic rules to remember when installing SIMMs on the processor board.

- The server supports 4 MB and 8 MB (must be 70 ns) and 16 MB and 32 MB (must be 60 or 70 ns) SIMMs.

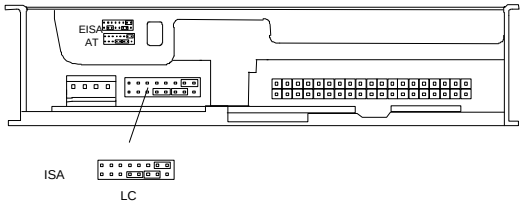
- You must install SIMMs in pairs (called banks) of matching size; however, the banks can be of different sizes.
- To achieve large memory configurations (greater than 144 MB) with the Pentium processor, you must remove and replace the SIMMs that are already installed in the server.
- If you obtain SIMMs from other sources, for 16 MB and 32 MB SIMMs, the speed must be 60 or 70 ns.

Video Memory - DRAM

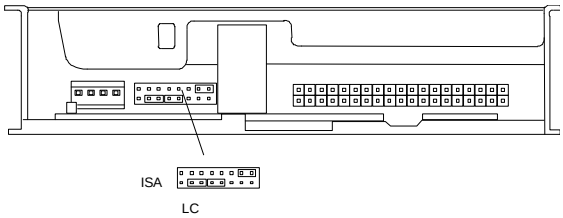
No additional video memory can be installed in the HP NetServer LC. Current video memory is 512 KB.

Flexible Disk Drive Guidelines

If you need to replace the flexible disk drive with the replacement part noted in the parts list, make sure that the jumpers on the back of the drive are set as following:



Replacement Flexible Disk Drive



Original Installed LC Flexible Disk Drive

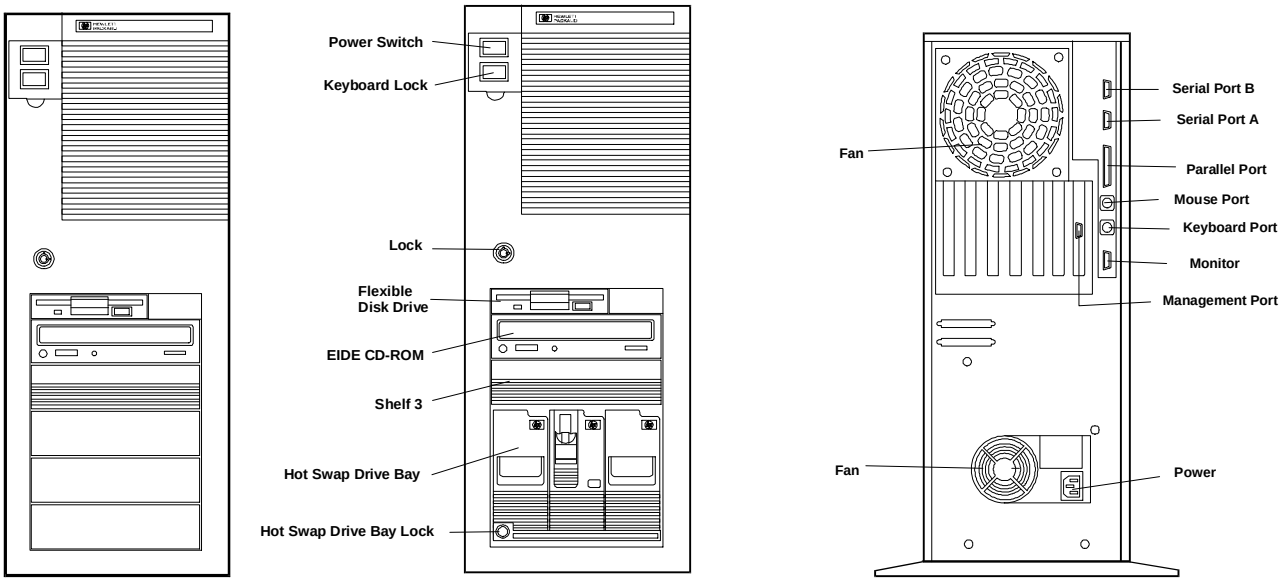
Operating Humidity	20 % to 80% relative humidity
BTU's	764.3 BTUs/hour maximum peak
Acoustic	Sound level (LpA): <58 dB(A)

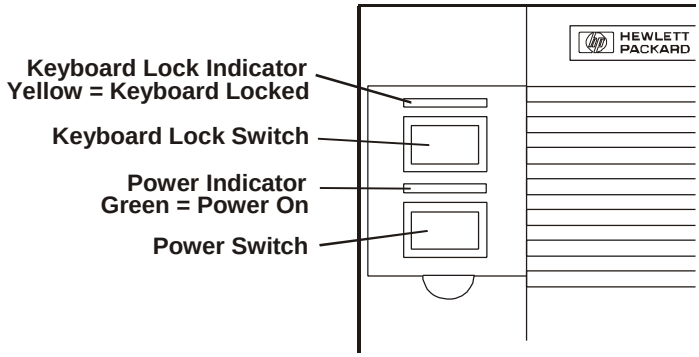
HP NetServer LC 3

System Views



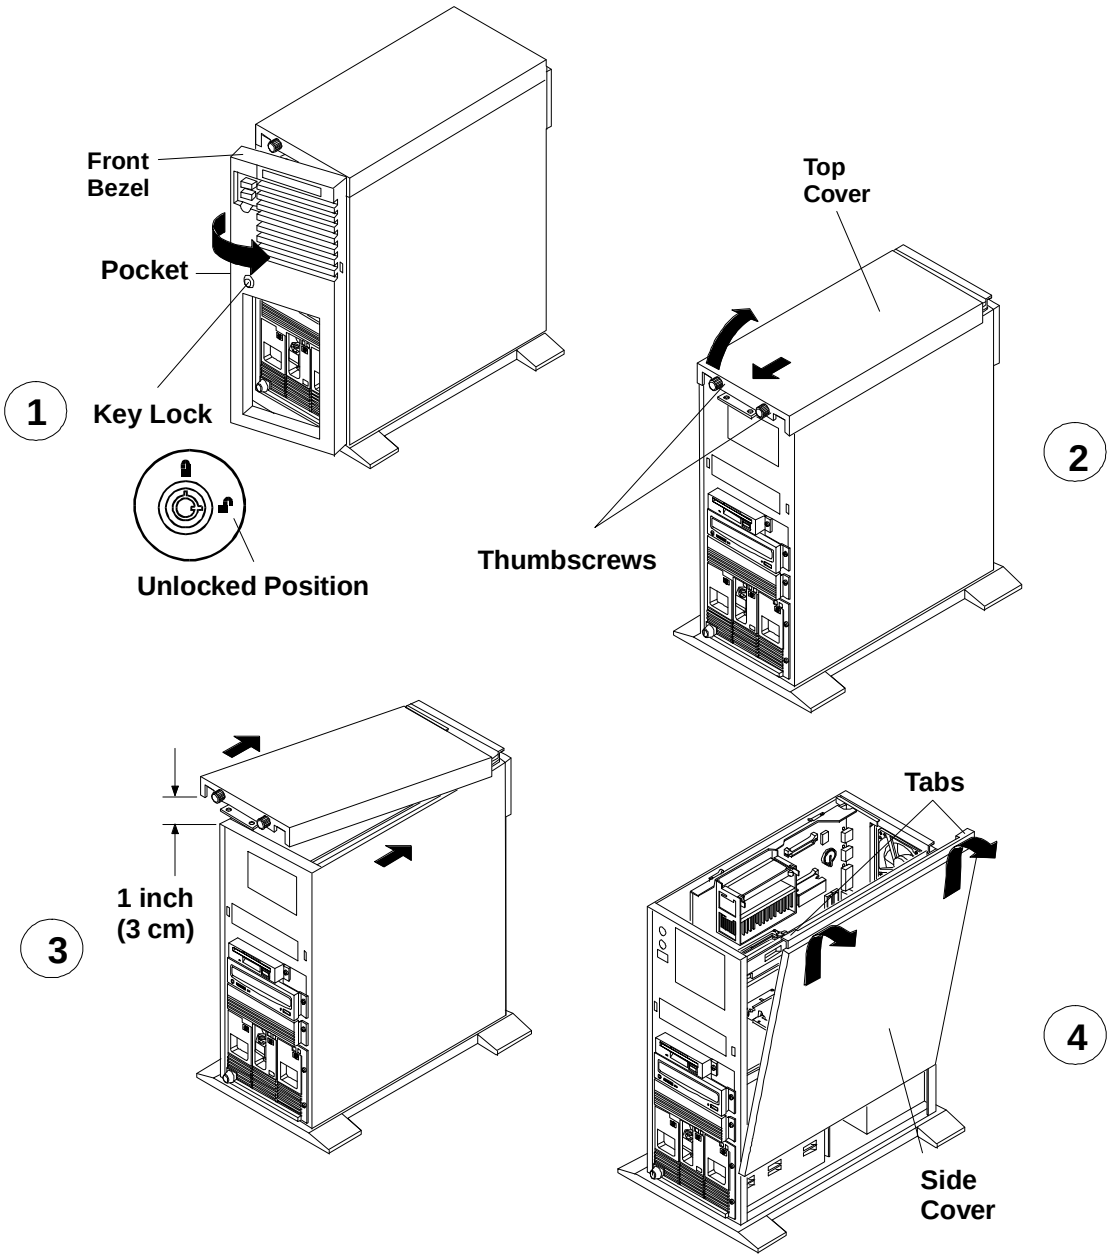
Front Control Panel

Power Switch	Turns the NetServer on and off. Note that when the NetServer is turned off, the power to the internal circuitry and mass storage devices is disabled; however, AC power is still applied to the power supply. **Always disconnect the power cord before removing the cover.**
Power Indicator	Lights green when the NetServer is on.
Keyboard Lock Switch	Prevents unauthorized use of the keyboard. Press the keyboard lock button to lock the keyboard. Enter the password to unlock the keyboard.
Keyboard Lock Indicator	Lights yellow when the keyboard is locked.



Covers

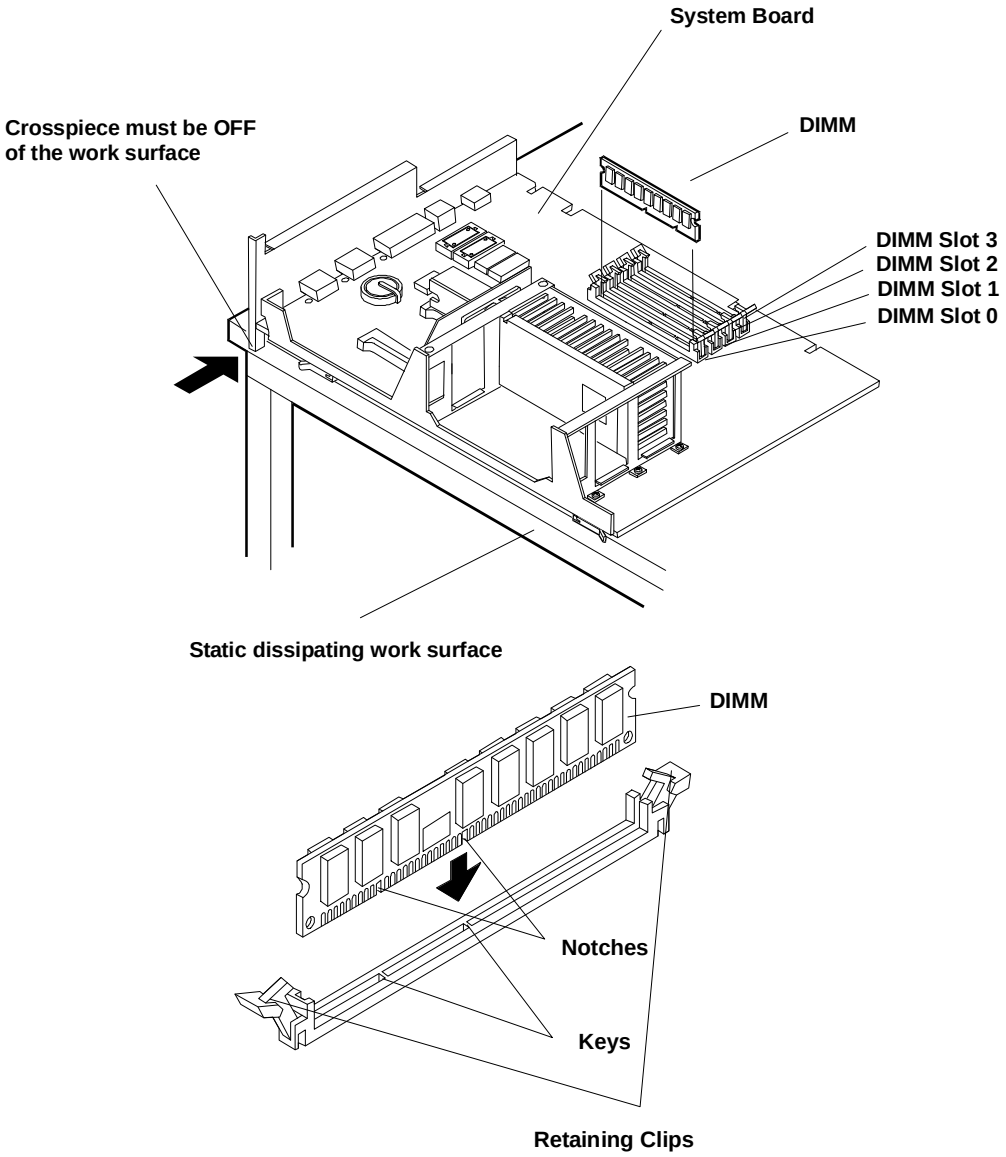
CAUTION	The covers are an integral part of the server. The server must be operated with the covers in place to ensure proper airflow for continued reliability and to maintain compliance with radio frequency interference and safety standards.



Memory

There are four DIMM sockets on the system board for memory expansion Follow these simple rules when you plan to install additional memory DIMMs:

- Use only HP DIMMs listed on the Technical Reference Label located inside the HP NetServer top cover, in Information Assistant, or in Order Assistant.
- DIMMs can be 32 MB, 64 MB, or 128 MB in any combination.
- DIMMs can be installed in any order in any of the four DIMM sockets.

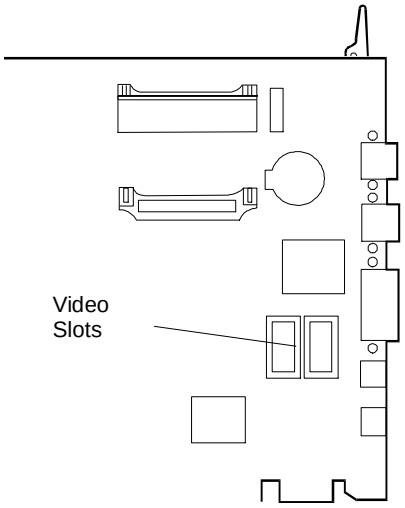


CAUTION	Only install DIMMs on a system board that is lying flat on a static-dissipating work surface. Do not rock the DIMM into place, but apply firm and even pressure directly downward.

Video Memory

Expand video memory by installing two 256 K x 16 (512 KB), 70 Ns, 40-pin SOJ package DRAM ICs.

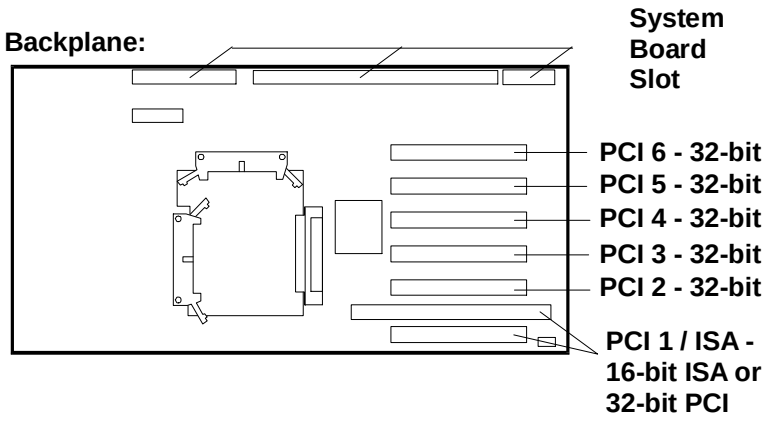
CAUTION	Install the chip in the correct orientation. Failure to do so will destroy the DRAM..



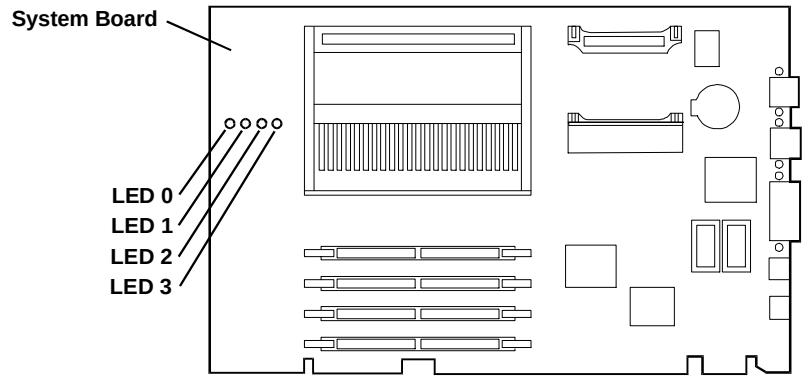
Boot Device Priority

The boot device priority is controlled by the Boot Device Ordering submenu of the Configuration menu of the Setup utility.

- IDE CD-ROM drive with bootable CD-ROM
- Flexible Disk with bootable flexible disk
- Embedded SCSI controller
- PCI boards in slots in the following order: 6, 5, 4, 3, 2, 1.
- **Hard Drive Priority:** Allows you to rearrange the order in which hard disk drives are searched for the operating system. All hard disk drives in the system are listed, as well as any bootable ISA board.



DIMM Slot LED Blink Codes



Processor Error Codes

Processor errors are indicated by blinking patterns of the DIMM slot LEDs that alternate at 1 Hz, as listed below:

Processor Error Status Indications					
✧ = LED off O = LED on LED 0	LED 1	LED 2	LED 3	Error Condition	Action
✧ O	O	O	O ✧	Voltage Regulator Module for Primary CPU Bad	Check that primary voltage regulator module (VRM) is correctly seated. If problem persists, replace VRM.
O ✧	✧	✧	✧ O	Voltage Regulator Module for Secondary CPU Bad	Check that secondary voltage regulator module (VRM) is correctly seated. If problem persists, replace VRM.
✧ O	O	O	✧ ✧	CPU Over Temperature	Check fan for function. Turn off system, wait 20-25 minutes for system to cool, and restart system.
O ✧	O ✧	✧ O	✧ O	CPU or Terminator Board Not Installed	Install CPU in primary CPU slot and CPU or terminator board in secondary CPU slot.

DIMM Status Error Codes

When no processor error condition exists, the DIMM slot LEDs display the status of the DIMMs in the corresponding slots, as follows:

- **OFF:** no DIMM installed
- **Flashes ON and OFF at 1 Hz in 50/50 proportion of time:** uncorrectable error or inappropriate DIMM
- **Flashes ON and OFF at 1 Hz in 90/10 proportion of time:** non-HP DIMM installed
- **ON:** HP DIMM installed

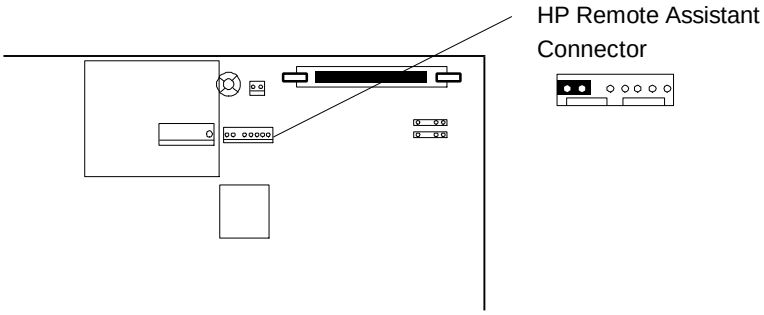
System Switches and Jumper Descriptions

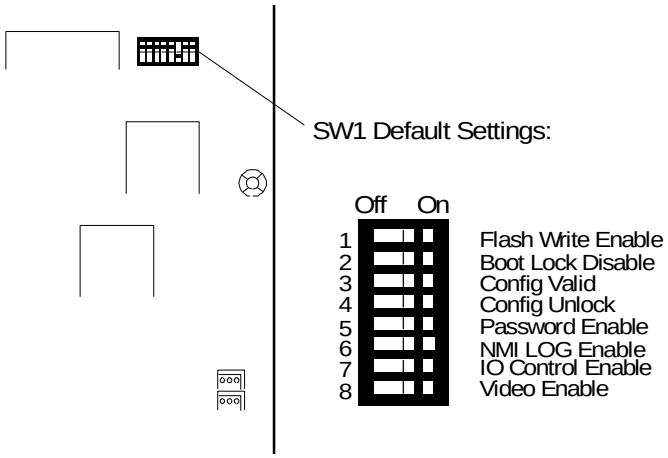
Remote Assistant Connector J25

This connector is used by the HP Remote Assistant Accessory, a 32-bit EISA Bus Master board used to remotely monitor server functionality. For additional information on this product, see the documentation that comes with it. When you install the HP Remote Assistant cable, you will need to remove the jumper on **PS REMOTE** and **PS ON**. If you remove HP Remote Assistant from the server, remember to re-install the jumper.



WARNING If the HP Remote Assistant is not installed and there is no jumper on PS REMOTE and PS ON, the system will NOT power up.

System Board Switch SW1



Switch	Function	Default
1	**FLASH WRITE ENABLE**: Enables or disables one of the two levels of flash ROM write protection (the other level of protection is controlled by the HP Update Utility). ON: The BIOS can be updated by the HP Update Utility. OFF: The BIOS is locked and cannot be updated.	ON
2	**BOOT BLOCK DISABLE:** Reserved. Must be set to ON for system to operate properly.	ON

Switch	Function	Default
3	**CONFIG VALID:** Saves or erases the current configuration information in NVRAM and CMOS. ON: Saves the current configuration. OFF: Erases the current system configuration.	ON
4	**CONFIG UNLOCK:** Prevents or allows the current system configuration maintained in NVRAM and CMOS to be changed. ON: Unlocked. Allows the current system configuration to be changed. OFF: Locked. Prevents the current system configuration from being changed.	ON
5	**ENABLE:** Enables or erases the power-on password maintained in NVRAM. ON: Power-on password functional. OFF: Erases the current power-on password.	ON
6	**NMI LOG ENABLE:** Allows or prevents system from generating SMI interrupt when NMI event occurs. **ON:** Enables NMI event to generate SMI interrupt. **OFF:** Disables NMI event from generating SMI interrupt.	ON
7	**IO CTRL ENABLE:** Enables or disables onboard flexible disk drive controller, IDE controller, and serial and parallel ports. ON: I/O controller enabled. OFF: I/O controller disabled.	ON
8	**VIDEO ENABLE**: Enables or disables built-in video. Disable the built-in video only if you have a separate video board installed in the server. ON: Enables built-in video. OFF: Disables built-in video.	ON

Memory

The processor board in this NetServer has 4 memory sockets which accept DIMM memory modules. Up to 512 MB of memory can be configured. When installing additional memory, note the following:

- Only these HP DIMMs are supported:

DIMM Type	HP Product Number
16 MB DIMM	D4294A
32 MB DIMM	D4295A
64 MB DIMM	D4296A
128 MB DIMM	D4297A

- Any combination of DIMMs, listed above, may be used.

NOTE The H-P warranty does not cover performance problems, equipment problems, or service calls resulting from the use of non-HP DIMMs.

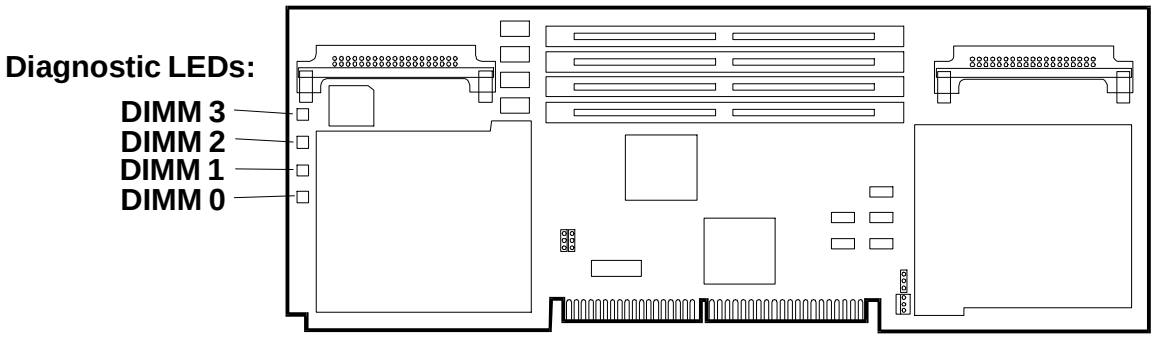
Select “Step 5: Save and exit” and follow the instructions to save your configuration. When the configuration is saved, the Reboot screen appears, describing what action you should take next. The EISA Configuration Utility will automatically update the system memory configuration.

Processor Board LED Blink Codes

The processor board in the NetServer LD Pro contains LEDs that can indicate memory errors and processor errors. When a memory error exists, the LEDs are either on, off, or flash repeatedly a constant memory error code. The table below describes each of these codes. If the memory error indicates a failed DIMM, replace the DIMM. When a processor error exists, the LEDs alternate between two codes (i.e., ON-OFF-OFF-OFF and OFF-ON-ON-ON).

On = Steady green
Flash = Regular, slow flash (1 Hz)
Blink = Regular, fast flash
Double-blink = Irregular, double-flash

The diagnostic LEDs are located on the processor board, are labeled DIMM 0 through 3, and correspond to DIMM sockets 0 through 3. The LEDs are visible from either side of the board, and can also be viewed through the NetServer's rear panel cooling perforations.



Memory Error Codes

LED Code	Definition	Action
Off	No DIMM installed or	N/A (normal)
	Non-EEPROM DIMM installed	Reseat the DIMM or Move it to another socket or Replace DIMM
On	HP DIMM installed	N/A (normal)
Flash	Inappropriate HP DIMM installed or	Replace with appropriate HP DIMM or Run Diagnostic Assistant to find the problem
	Hard memory error	Run Diagnostic Assistant to find the problem
Blink	Non-HP DIMM installed	N/A (normal for non-HP DIMM)
Double Blink	Inappropriate non-HP-DIMM installed or Hard memory error	Replace with appropriate DIMM or Run Diagnostic Assistant to find the problem Run Diagnostic Assistant to find the problem
	Hard memory error	Run Diagnostic Assistant to find the problem

LED Processor Error Codes

Alternating LED Codes: LED 0 LED 1 LED 2 LED 3	Definition	Action
ON-OFF-OFF-ON & OFF-ON-ON-OFF	Processor chip overtemperature	Check fans for function. Wait for system to cool down (20-25 minutes) and press the Reset button
OFF-OFF-ON-ON & ON-ON-OFF-OFF	Primary processor chip (processor #1) not installed	Install processor chip in primary socket
ON-OFF-OFF-OFF & OFF-ON-ON-ON	Primary Voltage Regulator Module fault	Replace primary Voltage Regulator Module
OFF-ON-OFF-OFF & ON-OFF-ON-ON	Secondary Voltage Regulator Module fault	Replace secondary Voltage Regulator Module
OFF-OFF-OFF-ON & ON-ON-ON-OFF	System bus regulator fault	Replace processor board

NOTE If the processor overtemperature error is not corrected within a few minutes, the system will shut down automatically to avoid damage. To recover from this condition, wait for the system to cool down (20-25 minutes) and press the Reset button.

Boot Device Priority

The following is the search path in order of the highest boot device priority:

1. CD-ROM drive with bootable CD-ROM
2. Flexible disk drive with bootable flexible disk
3. IDE drive
4. The first mass storage device attached to the EISA, ISA or PCI (embedded or added) controller set to the lowest BIOS address. The lowest BIOS address is usually C8000h.

To Boot From a PCI Controller Board

Systems with only PCI boards (No EISA or ISA Boards)

Your system uses the following **default PCI boot priority order**:

1. Embedded SCSI A
2. PCI slots in the following order: 9, 8, 7, and 6.

If you have drives attached to the SCSI A connector, you must change the PCI boot priority order in the EISA Configuration Utility so that the PCI slots precede SCSI A:

To change the PCI boot priority order, perform the following:

1. Go to the EISA Configuration Utility.
2. Select "Step 3: View or edit details."
3. Select "PCI SCSI Boot Priority Order" and press **Enter**.
4. Set to "PCI adapters before SCSI A" and press **Enter**.
5. Exit and save the configuration.

Systems with PCI and EISA or ISA boards

If you have a system with a mixture of PCI and ISA or EISA boards perform the following:

1. Install the PCI controller board in slot 9.
2. Go to the EISA Configuration Utility.
3. Select "Step 3: View or edit details."
4. Select "PCI 9 - PCI SCSI Controller" and press **F6**.
5. Set the top Memory Address resource to "0C8000h" and press **F10**.
6. Press **F7** and select "Lock/unlock boards." Select the PCI board in slot 9 and lock.
7. Exit and save the configuration.

To Boot From an Embedded PCI Controller (SCSI A)

Systems with only PCI boards (No EISA or ISA Boards)

If you only have PCI boards in your NetServer, your system uses the following **default PCI boot priority order**:

1. Embedded SCSI A
2. PCI slots in the following order: 9, 8, 7, and 6.

Systems with PCI and EISA or ISA boards

If you have a system with ISA or EISA boards, you must set the BIOS and other memory resources for those boards to the top of the D0000h range.

To Boot From an ISA Controller Board

Set the BIOS address to C8000h.

To Boot From an EISA Controller Board

1. Go to the EISA Configuration Utility.
2. Select "Step 3: View or edit details."
3. Set the controller's BIOS to C8000h.

SCSI Controller Boot Order

During boot, the system BIOS performs the following:

1. The system BIOS will start searching for BIOS ROMs at 0C8000h.
2. If an ISA, EISA or locked PCI BIOS controller is found, the system will call that BIOS to initialize. The controller BIOS that is called first will normally be the boot controller.
3. If the memory range at 0C8000h is not being used, the system will search through the list of PCI devices for the first PCI BIOS that will fit in the open memory range. The system will search the PCI devices in the following order: Embedded SCSI A, PCI slot 9, slot 8, slot 7, slot 6. If the system BIOS finds a PCI BIOS that fits in the open memory range, that PCI BIOS will be shadowed at 0C8000h and called to initialize.
4. After calling the BIOS ROM, the system will continue searching for BIOS ROMs at the address immediately following the BIOS ROM just called (repeat steps 2 through 4).

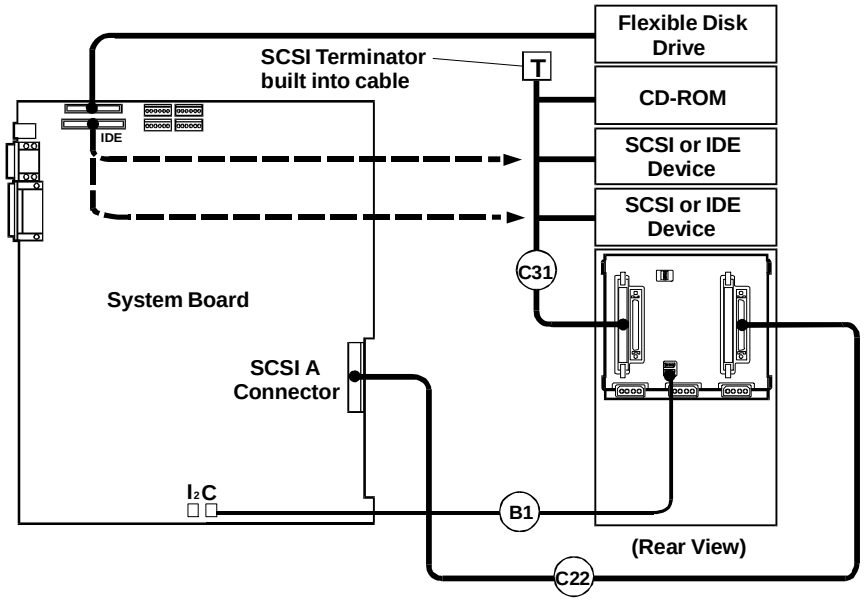
NOTE	In order to optimize PCI board BIOS installation, you need to leave the largest open range of memory possible. Group the EISA and ISA board BIOSs at either the beginning or end of the 0C8000h through 0DFFFFh range.

Cabling Configurations

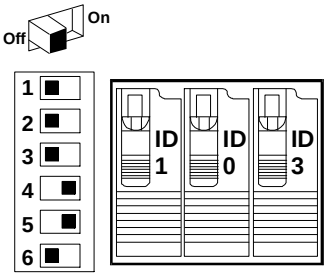
Duplex, Non-Disk Array Model with Internal Controller

This is a standard mass storage configuration as shipped from HP.

NOTE	If you are installing Ultra SCSI mass storage devices in this NetServer, you must enable Ultra SCSI.



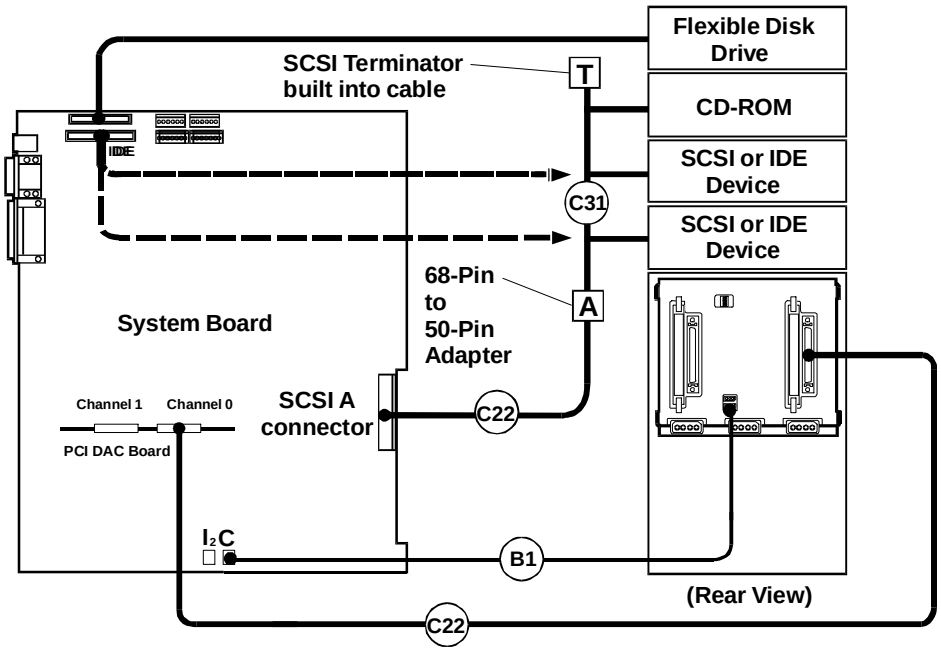
Default Switch Settings



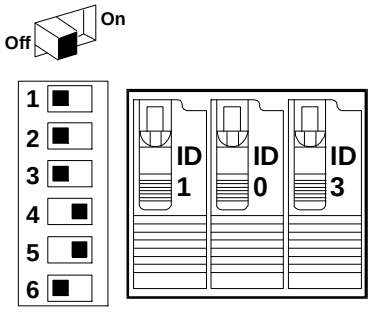
This is the default SCSI switch setting for this configuration. SCSI ID 2 is reserved for an optional DAT (Digital Audio Tape) drive that can be installed in upper drive tray 3 or 4. The standard CD-ROM drive is shipped with SCSI ID 5.

Duplex Disk Array Configuration with Dual Channel PCI Controller Board

This is one of several possible optional mass storage configurations. You are not limited to the configurations shown on this CD-ROM; this is only given as an example.



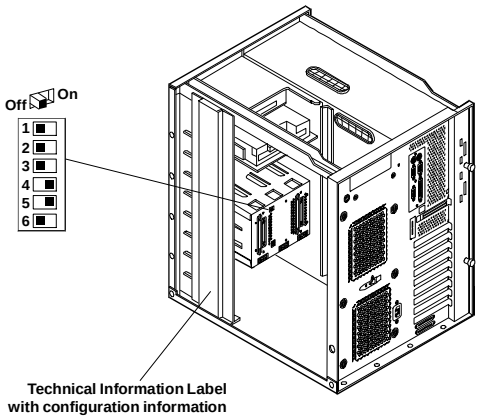
Default Switch Settings



This is the default SCSI switch setting for this configuration. SCSI ID 2 is reserved for an optional DAT (Digital Audio Tape) drive that can be installed in upper shelf 3 or 4. The standard CD-ROM drive is shipped with SCSI ID 5.

Configuring Switch Settings on the Hot Swap Subsystem

Switches 3 and 4 determine the SCSI address of each of the shelves. Possible switch settings are given in the table below.



Always set switches 1, 2 and 6 to Off.

Switch	Function	Settings
1	**I^2C Bus Setting**	Always set to **Off**
2	**I^2C Bus Setting**	Always set to **Off**
3	**High/Low Addresses** Sets SCSI addresses for upper or lower eight addresses Set to Off if not using Fast-Wide (68 pin) SCSI	**On** Sets drives to upper eight SCSI addresses. **Off** Sets drives to lower eight SCSI addresses.
4	**SCSI Address Zero** Sets middle shelf in hot-swap cage to SCSI ID 0.	**On** Sets middle shelf in the cage (shelf 2) to SCSI ID 0. **Off** Sets middle shelf to SCSI ID 2.
5	**Remote Start** Determines control of the hot swap disk module power-on sequence.	**On** Internal control: cage is set to delayed start. *Recommended setting.*
6	**Reserved**	Always set to **Off**

Hot Swap Subsystem SCSI Address Settings

Switches 3 and 4 determine the SCSI address setting for each shelf in the hot swap subsystem. The table below lists the possible SCSI addresses for each shelf.

NOTE For information on changing the CD-ROM drive SCSI address setting, see the Technical Information Label on the CD-ROM drive.

Hot-Swap Shelf SCSI Address Settings

Switch		
3	**4**	**SCSI Address**
Off	Off	Shelf 1 = ID 1 Shelf 2 = ID 2 Shelf 3 = ID 3
Off	On	Shelf 1 = ID 1 Shelf 2 = ID 0 Shelf 3 = ID 3

On	Off	Shelf 1 = ID 9 Shelf 2 = ID 10 Shelf 3 = ID 11
On	On	Shelf 1 = ID 9 Shelf 2 = ID 8 Shelf 3 = ID 11

Parts List

NOTE The part numbers in the list were the ones that were available at the time of publication. Part numbers may change after publication. HP's parts price list database will generally contain a reference to the revised part number.

If a system board needs to be replaced, remove processor board and any added accessory boards, and keep them with the server under repair.

DX OverDrive/66	ODPR486DX-66	DX	OFF	ON
DX OverDrive/66	ODP486DX-66	487	ON	OFF

Memory Configuration

You can install any HP supported 4 MB, 8 MB, 16 MB, and 32 MB SIMMs in any socket and any arrangement.

Video Memory - DRAM

Install two additional DRAM chips to upgrade the server to 512 KB of RAM which lets the display use resolutions of 640x480 with 256 colors and 800x600 with 256 colors.

Use video memory DRAM chips that are 16-pin DIP (Dual Inline Package) 256 KBx4 Fast Page Mode DRAM and run at 80 nanoseconds or faster. The chips must be compatible with the Trident TVGA 9000B controller chip.

Trident has tested the following DRAM:

Vendor	Part Number	Vendor	Part Number
Goldstar	GM71C256A-80 9103	NMBS	AAA1M304P-08 9130
Intel	P2101-09 K049A	Samaung	MK44C256AP-8 104
Mitsubishi	M5M44256AP-8 8492	Vitalic	V52C104AP-80 9105
NEC	D424256C-80 8939		

HP NetServer LE System Updates

These notes reflect changes for the HP NetServer LE which could not be included with the service manual or were changed at a later date. Service manuals are not updated and the information, if any, in this section is the latest information available.

Loading DOS in a 640K environment if the base memory size is set to 512K.

When the base memory size is set to 512K, you will not be able to run the "Configure computer" option from SAM. To create the proper operating environment so that "Configure computer" option will run, you must modify the CONFIG.SYS file found on the NetServer #1 diskette.

The System Administration Manager CONFIG.SYS file on NetServer #1 diskette originally contains the following lines:

```
COUNTRY=001, , A:\COUNTRY.SYS
DEVICE=A:\DISPLAY.SYS CON:=(, 437, 2)
DEVICE=HIMEM.SYS
SHELL=A:\SAM.EXE /P
```

Using the editor of your choice, modify the CONFIG.SYS file so it appears as follows:

```
DEVICE=A:\SET640K.SYS
COUNTRY=001, , A:\COUNTRY.SYS
DEVICE=A:\DISPLAY.SYS CON:=(, 437, 2)
DEVICE=HIMEM.SYS
SHELL=A:\SAM.EXE /P
```

Save the file when you finish.

Creating the Proper Operating Environment

1. Insert NetServer #1 diskette in drive A.

2. Make a backup copy of your current CONFIG.SYS file by entering;
   COPY CONFIG.SYS CONFIG.BAK
3. Copy the SET640K.SYS file from NetServer #2 diskette to NetServer #1 diskette by entering;

   COPY B:SET640K.SYS A:\
   (If you do not have a second flexible disk drive, DOS treats drive A as both drive A and

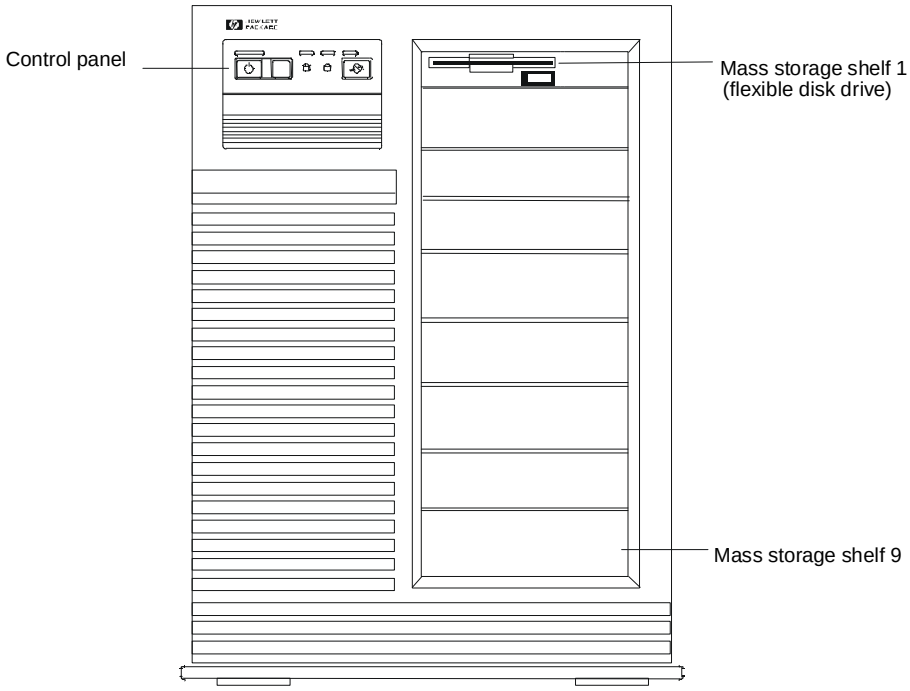
   drive B and prompts you to insert disks.)
4. Using the editor of your choice, modify the CONFIG.SYS file so that SET640K.SYS file is the first file on line 1, as shown above.
5. Save the file when you are done editing.

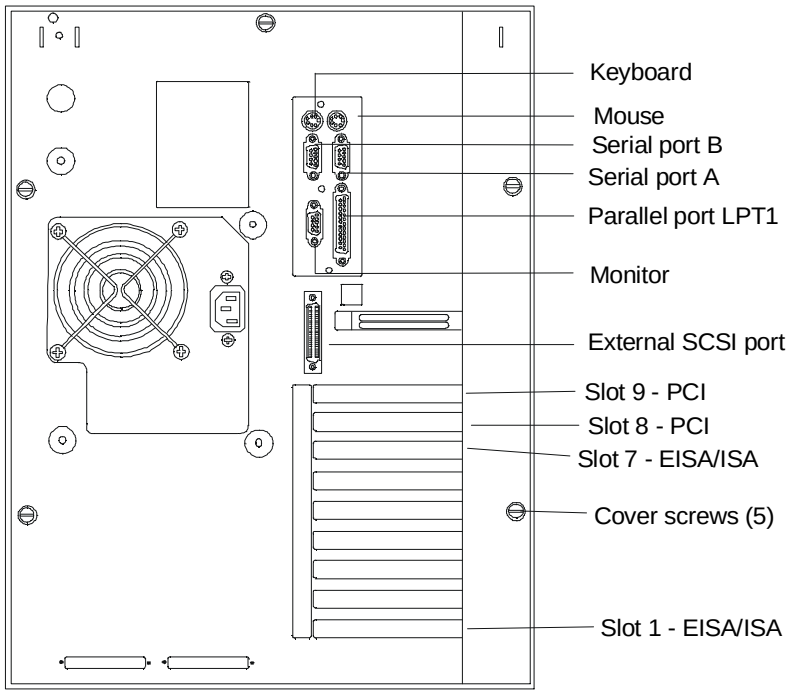
When you next boot from the NetServer #1 diskette, if the base memory size is 512K you are prompted to press Enter when the banner appears. If the base memory size is set to 640K, the utility displays only the driver banner with no prompt. The function of this driver does not change the base memory size setting selected in the EISA configuration Utility.

Specifications

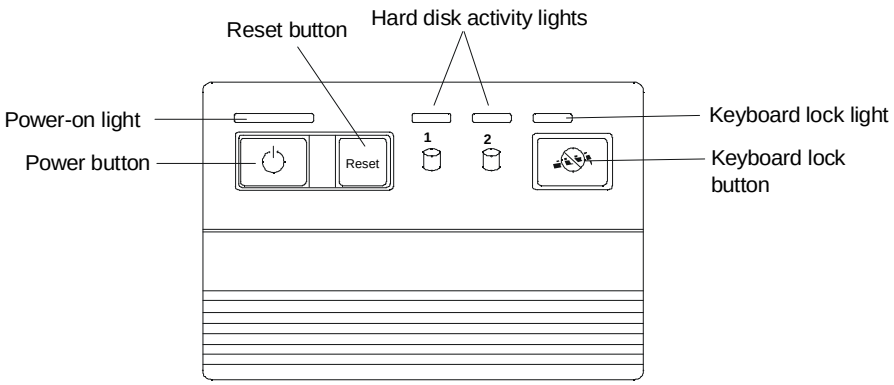
Power Supply	Auto ranging: 90 to 132 VAC, or 198 to 264 VAC at 47-63Hz
Power Availability	227W continuous, 245W peak
Power Consumption	376/354W maximum with 110/220V supply 405/382W peak with 110/220V supply
System Dimensions	18.5 in. high x 10.2 in wide x 16.5 in deep (47 cm high x 26 cm wide x 42 cm deep)
System Weight	25 lbs (11.3 kg), depending on configuration
Operating Temperature	41 to 104 degrees F (5 to 40 degrees C)
Operating Humidity	15% to 80% non-condensing

System Views





Control Panel



Power button	Turns the server on and off. Note that when the server is turned off, the power to the internal circuitry and mass storage devices is disabled; however, AC power is still applied to the power supply. Always disconnect the power cord before removing the cover.
Power-on light	Green when the server is on.
Reset button	Restarts the server. You can press this button if the server “hangs” or “locks up”—it has the same effect as turning the server off and on. Save any work before pressing the reset button. Any information not saved is lost when the server shuts down.
Hard disk activity light 1	Yellow when an internal SCSI storage system (channel A) or an IDE hard disk drive is busy.
Hard disk activity light 2	Yellow when an external SCSI hard disk drive (channel B).
Keyboard lock button	Prevents unauthorized use of the keyboard. Press the keyboard lock button to lock the keyboard. Enter the password to unlock the keyboard.
Keyboard lock light	Yellow when the keyboard is locked.

Parts List

NOTE The part numbers in the list were the ones that were available at the time of publication. Part numbers may change after publication. HP's parts price list database will generally contain a reference to the revised part number. If a system board needs to be replaced, remove the ROM chip, processor board, any added accessory boards, and keep them with the server under repair.

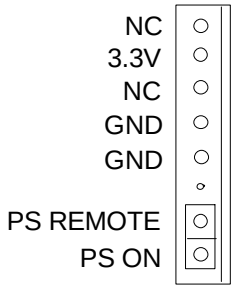
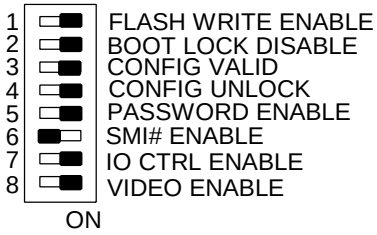
System Board Connector J6

This connector is used by the HP Remote Assistant Accessory, a 32-bit EISA Bus Master board used to remotely monitor server functionality. For additional information on this product, see the documentation that comes with it. When you install the HP Remote Assistant cable, you will need to remove the jumper on PS REMOTE and PS ON. If you remove HP Remote Assistant from the server, **you must reinstall the jumper for the server to boot**.



SW1 Switch and Default Settings



Switch	Function	Default
1	**FLASH WRITE ENABLE:** Enables or disables one of the two levels of flash ROM write protection (the other level of protection is controlled by the HP Update Utility). **ON:** The BIOS can be updated by the HP Update Utility. **OFF:** The BIOS is locked and cannot be updated.	ON
2	**BOOT BLOCK DISABLE:** Reserved. Must be set to ON for system to operate properly.	ON
3	**CONFIG VALID**: Saves or erases the current configuration information in NVRAM and CMOS. **ON:** Saves the current configuration. **OFF:** Erases the current system configuration.	ON
4	**CONFIG UNLOCK**: Prevents or allows the current system configuration maintained in NVRAM and CMOS to be changed. **ON**: Unlocked. Allows the current system configuration to be changed. **OFF**: Locked. Prevents the current system configuration from being changed.	ON
5	**PASSWORD ENABLE**: Enables or erases the power-on password maintained in NVRAM. **ON**: Power-on password functional. **OFF**: Erases the current power-on password.	ON
6	**SMI# ENABLE: Not used. Leave set on default.** **OFF:** Prevents SMI interrupt.	OFF
7	**IO CTRL ENABLE**: Enables or disables onboard flexible disk drive controller, IDE controller, and serial and parallel ports. **ON**: I/O controller enabled. **OFF**: I/O controller disabled.	ON
8	**VIDEO ENABLE:** Enables or disables built-in video. Disable the built-in video only if you have a separate video board installed in the server. **ON**: Enables built-in video. **OFF**: Disables built-in video.	ON

Memory

Memory for the HP NetServer LF is installed on the processor board. The Intel 486 processor board has 8 MB of single-density base memory installed in bank 0. This memory is not customer removable and **can only be single-density**. There are two banks (four sockets) available for expansion memory which can be single or double density. The maximum memory supported is 136 MB (4 x 32 MB + 8 MB).

The Pentium processor board has 16 MB of removable base memory installed. There are two more banks (four sockets) available for expansion. The maximum memory supported is 192 MB (6 x 32 MB).

- The server supports 4 MB, 8 MB, 16 MB, and 32 MB (70 ns) SIMMs.
- You must install SIMMs in pairs (called banks) of matching size; the banks, however, can be of different sizes.
- To achieve large memory configurations (greater than 144 MB) with the Pentium processor, you must remove and replace the SIMMs that are already installed in the server.

Video Memory

No additional video memory can be installed in the HP NetServer LF. Current video memory is 512 KB.

Specifications

Power Supply	Auto-ranging 90 to 132 VAC, or 198 to 264 VAC at 47-63Hz
Power Availability	386W continuous; 458W peak
Power Consumption	551/529W maximum with 110/220V supply 654/627W peak with 110/220V supply
System Dimensions	19.3 in. high x 13.7 in wide x 18.1 in deep (49 cm high x 34.8 cm wide x 46 cm deep)
System Weight	50-70 lbs depending on configuration (22.7-31.8 kg)
Operating Temperature	41 to 95 degrees F (5 to 35 degrees C)
Operating Humidity	20% to 80% non-condensing

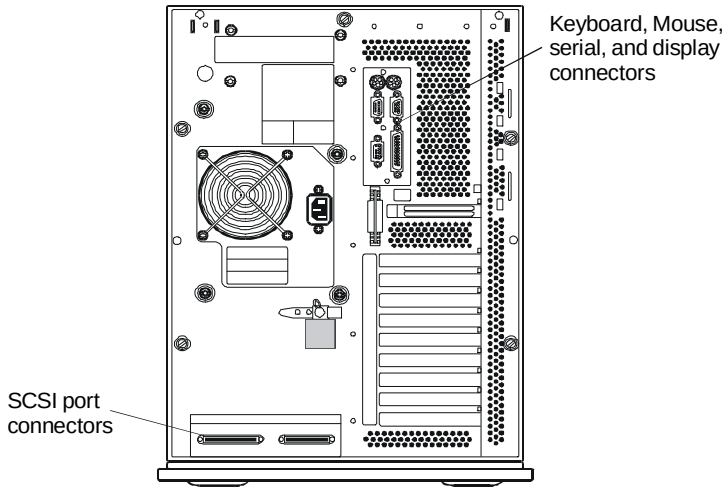
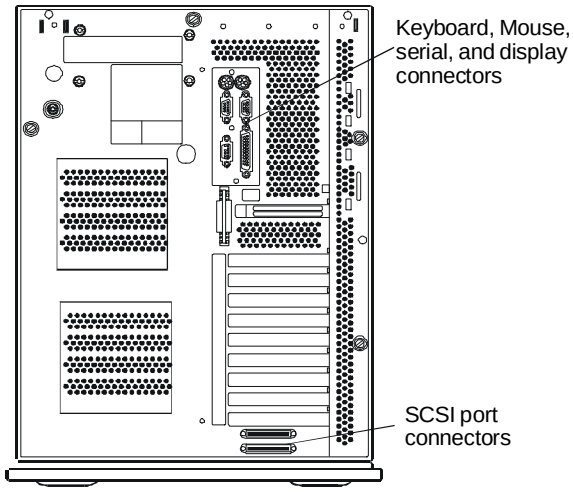
HP NetServer LH Pro

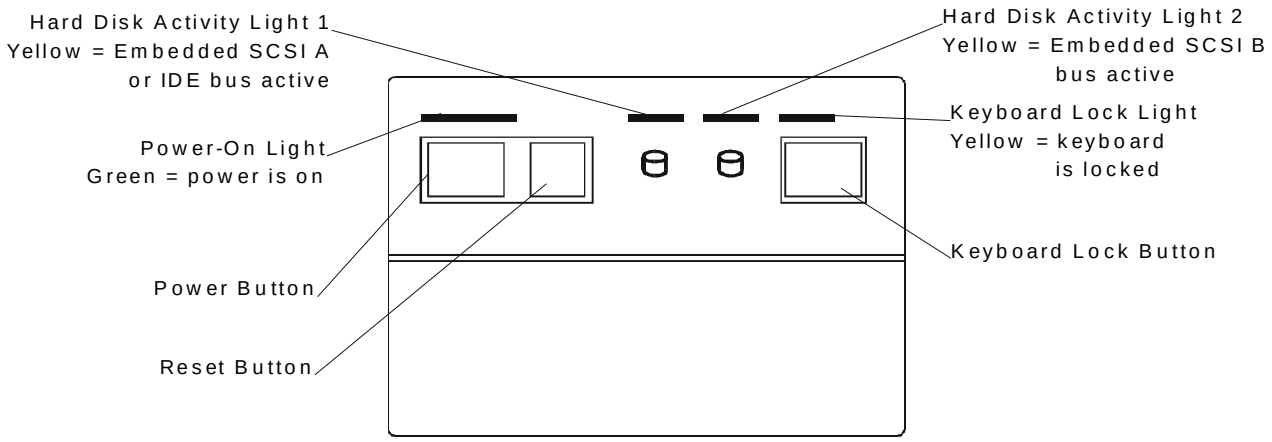


HP NetServer LH



HP NetServer LH Plus

Control Panel



The following list describes each item on the control panel.

Power Button	Turns the HP NetServer on and off. Note that when the HP NetServer is turned off, the power to the internal circuitry and mass storage devices is disabled; however, AC power is still applied to the power supply. **Always disconnect the power cord before removing the cover.**
Power-On Light	Green when the HP NetServer is on.
Reset Button	Restarts the HP NetServer. You can press this button if the HP NetServer "hangs" or "locks up"—it has the same effect as turning the HP NetServer off and on. Save any work before pressing the reset button. Any information not saved is lost when the HP NetServer shuts down.
Hard Disk Activity Light 1	Yellow indicates activity on the Embedded SCSI A bus or IDE bus.
Hard Disk Activity Light 2	Yellow indicates activity on the Embedded SCSI B bus.
Keyboard Lock Button	Prevents unauthorized use of the keyboard. Press the keyboard lock button to lock the keyboard. Enter the password to unlock the keyboard. For more information, see **Setting Keyboard Lock Button**.
Keyboard Lock Light	Yellow when the keyboard is locked.

Cover

CAUTION	The cover is an integral part of the server. The server must be operated with the cover in place to ensure proper airflow for continued reliability and to maintain compliance with radio frequency interference and safety standards.

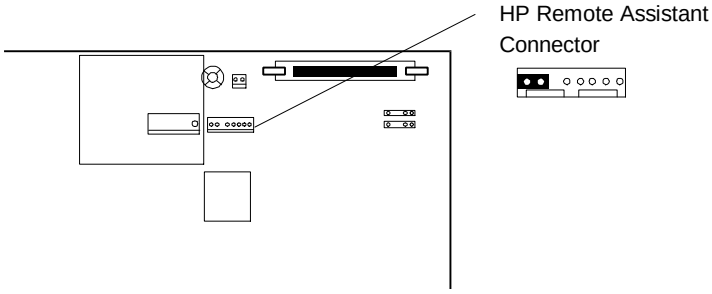
System Switches and Jumper Descriptions

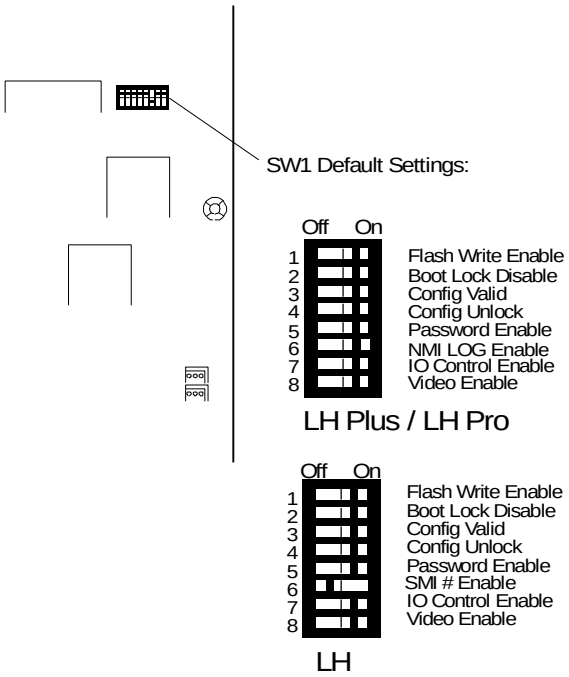
Remote Assistant Connector - J22 (LH) and J25 (LH Plus/LH Pro)

This connector is used by the HP Remote Assistant Accessory, a 32-bit EISA Bus Master board used to remotely monitor server functionality. When you install the HP Remote Assistant cable, you need to remove the jumper on **PS REMOTE** and **PS ON**. If you remove HP Remote Assistant from the server, remember to re-install the jumper.



WARNING	If the HP Remote Assistant is not installed and there is no jumper on PS REMOTE and PS ON, the system will NOT power up.

System Board Switch SW1



Switch	Function	Default
1	**FLASH WRITE ENABLE**: Enables or disables one of the two levels of flash ROM write protection (the other level of protection is controlled by the HP Update Utility). ON: The BIOS can be updated by the HP Update Utility. OFF: The BIOS is locked and cannot be updated.	ON
2	**BOOT BLOCK DISABLE:** Reserved. Must be set to ON for system to operate properly.	ON
3	**CONFIG VALID:** Saves or erases the current configuration information in NVRAM and CMOS. ON: Saves the current configuration. OFF: Erases the current system configuration.	ON
4	**CONFIG UNLOCK:** Prevents or allows the current system configuration maintained in NVRAM and CMOS to be changed. ON: Unlocked. Allows the current system configuration to be changed. OFF: Locked. Prevents the current system configuration from being changed.	ON
5	**PASSWORD ENABLE:** Enables or erases the power-on password maintained in NVRAM. ON: Power-on password functional. OFF: Erases the current power-on password.	ON
6	**SMI# ENABLE:** Not used; leave in the default position.	OFF (LH) ON (LH Plus/Pro)

Switch	Function	Default
7	**IO CTRL ENABLE:** Enables or disables onboard flexible disk drive controller, IDE controller, and serial and parallel ports. ON: I/O controller enabled. OFF: I/O controller disabled.	ON
8	**VIDEO ENABLE**: Enables or disables built-in video. Disable the built-in video only if you have a separate video board installed in the server. ON: Enables built-in video. OFF: Disables built-in video.	ON

HP NetServer LH Memory Configuration

- The following HP SIMMs are supported:

Type	Product Number
8 MB ECC SIMM	D3597A
16 MB ECC SIMM	D3592A
32 MB ECC SIMM	D3593A

- SIMMs must be installed in pairs.
- SIMMs must be installed in sequential order starting with Banks 0/1.

HP NetServer LH Plus/Pro Memory Configuration

The processor board has 4 memory sockets which accept DIMM memory modules. Up to 512 MB of memory can be added. When installing additional memory, note the following:

- Only these HP DIMMs are supported:

DIMM Type	HP Product Number
16 MB DIMM	D4294A
32 MB DIMM	D4295A
64 MB DIMM	D4296A
128 MB DIMM	D4297A
256 MB DIMM	D4926A

- Any combination of DIMMs, listed above, may be used.

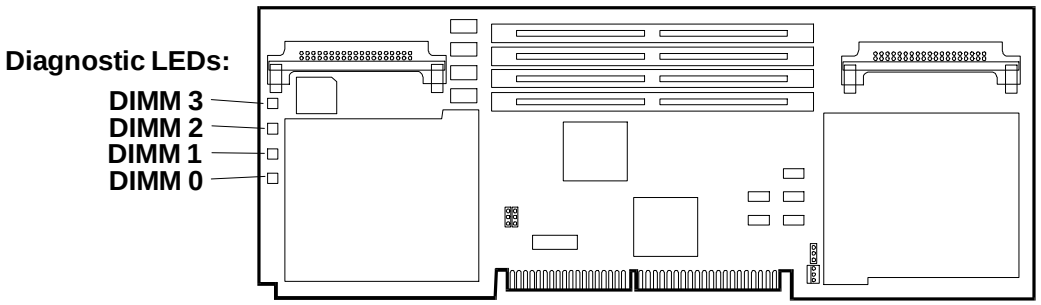
NOTE The HP warranty does not cover performance problems, equipment problems, or service calls resulting from the use of non-HP DIMMs.

LH Plus/Pro Processor Board LED Blink Codes

The Processor board in the NetServer LH Plus or Pro contains LEDs that can indicate memory errors and processor errors. When a memory error exists, the LEDs are either on, off, or flash repeatedly a constant memory error code. The table below describes each of these codes. If the memory error indicates a failed DIMM, replace the DIMM. When a processor error exists, the LEDs alternate between two codes (i.e., ON-OFF-OFF-OFF and OFF-ON-ON-ON).

On = Steady green
Flash = Regular, slow flash (1 Hz)
Blink = Regular, fast flash
Double-blink = Irregular, double-flash

The diagnostic LEDs are located on the the processor board, are labeled DIMM 0 through 3, and correspond to DIMM sockets 0 through 3. The LEDs are visible from either side of the board, and can also be viewed through the NetServer's rear panel cooling perforations.



Memory Error Codes

LED Code	Definition	Action
Off	No DIMM installed or	N/A (Normal)
	Non-EEPROM DIMM installed	Reseat the DIMM or Move it to another socket or Replace DIMM
On	HP DIMM installed	N/A (normal)
Flash	Inappropriate HP DIMM installed or	Replace with appropriate HP DIMM or Run Diagnostic Assistant to find the problem
	Hard memory error	Run Diagnostic Assistant to find the problem
Blink	Non-HP DIMM installed	N/A (normal for non-HP DIMM)
Double Blink	Inappropriate non-HP-DIMM installed or Hard memory error	Replace with appropriate DIMM or Run Diagnostic Assistant to find the problem Run Diagnostic Assistant to find the problem
	Hard memory error	Run Diagnostic Assistant to find the problem

LED Processor Error Codes

Alternating LED Codes: LED 0	LED 1	LED 2	LED 3	Definition	Action
ON-OFF-OFF-ON & OFF-ON-ON-OFF				Processor chip overtemperature	Check fans for function. Wait for system to cool down (20-25 minutes) and press the

		Reset button
OFF-OFF-ON-ON & ON-ON-OFF-OFF	Primary processor chip (processor #1) not installed	Install processor chip in primary socket
ON-OFF-OFF-OFF & OFF-ON-ON-ON	Primary Voltage Regulator Module fault	Replace primary Voltage Regulator Module
OFF-ON-OFF-OFF & ON-OFF-ON-ON	Secondary Voltage Regulator Module fault	Replace secondary Voltage Regulator Module
OFF-OFF-OFF-ON & ON-ON-ON-OFF	System bus regulator fault	Replace processor board

NOTE If the processor overtemperature error is not corrected within a few minutes, the system will shut down automatically to avoid damage. To recover from this condition, wait for the system to cool down (20-25 minutes) and press the Reset button.

Boot Device Priority

The following is the search path in order of the highest boot device priority:

1. CD-ROM drive (if a bootable CD-ROM is installed)
2. Flexible disk drive
3. IDE device
4. SCSI controller board with the following:
    - EISA controller board with the BIOS address set to C8000.
    - ISA controller board with the BIOS address set to C8000.
    - PCI controller board in slot 9 with the BIOS address set and locked at C8000.
5. Embedded SCSI A controller.
6. Embedded SCSI B controller.

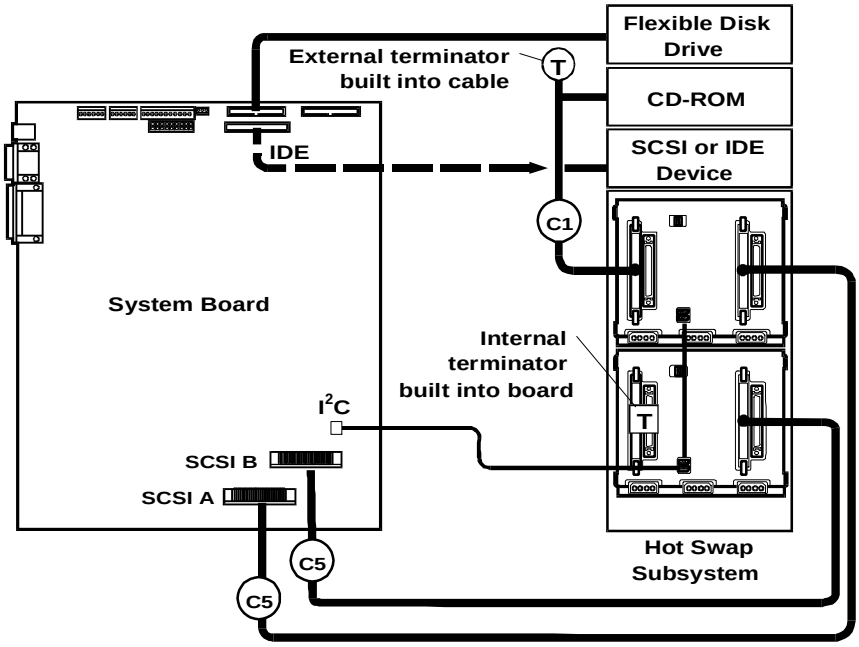
To boot from a SCSI controller board, perform the following:

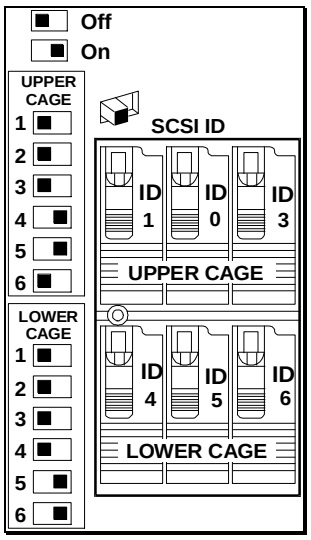
- To boot from an **EISA controller board**, use "Step 3: View or edit details" of the EISA Configuration Utility to set the controller's BIOS to C8000.
- To boot from an **ISA controller board**, set the BIOS address to C8000.
- To boot from a **PCI controller board**, perform the following:
    1. Install PCI controller board in slot 9.
    2. Run EISA Configuration Utility and select "Step 3: View or edit details".
    3. Select "PCI SCSI Controller in Slot 9" and press **F6**.
    4. Set the top Memory Address resource to "0C8000h" and press **F10**.
    5. Press **F7** and select "Lock/unlock boards". Select the PCI board in slot 9 and lock.
    6. Exit and save the configuration.

Cabling Configurations

The HP NetServer comes in two standard models that can be reconfigured by changing the cables. You are not limited to these configurations, but they are given as possible examples.

Duplex, non-disk array model with internal controller (standard model)

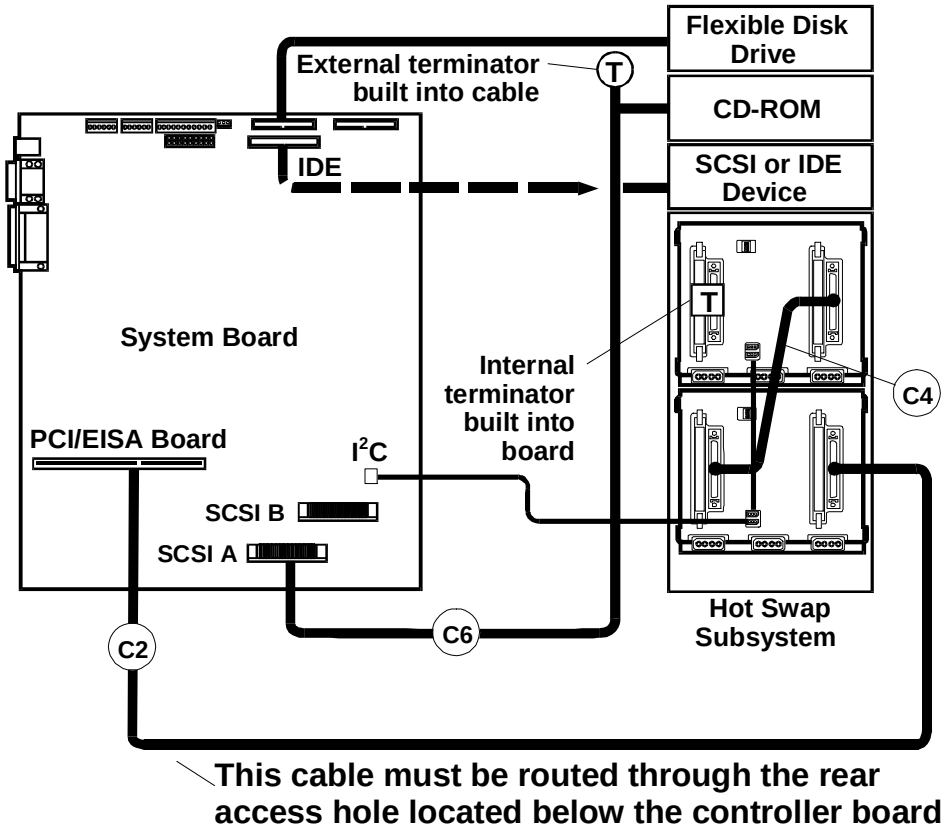


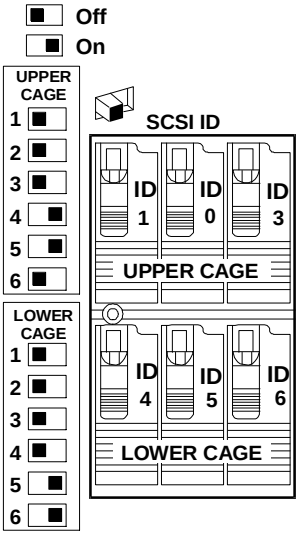


Default Switch Settings

These are the default SCSI address settings for this model. SCSI ID 2 is reserved for an added DAT (Digital Audio Tape) drive that can be installed in the upper horizontal Shelf 3. The CD-ROM drive is set for SCSI ID 5.

Non-duplex, disk array model with PCI controller board (standard model) or EISA controller board



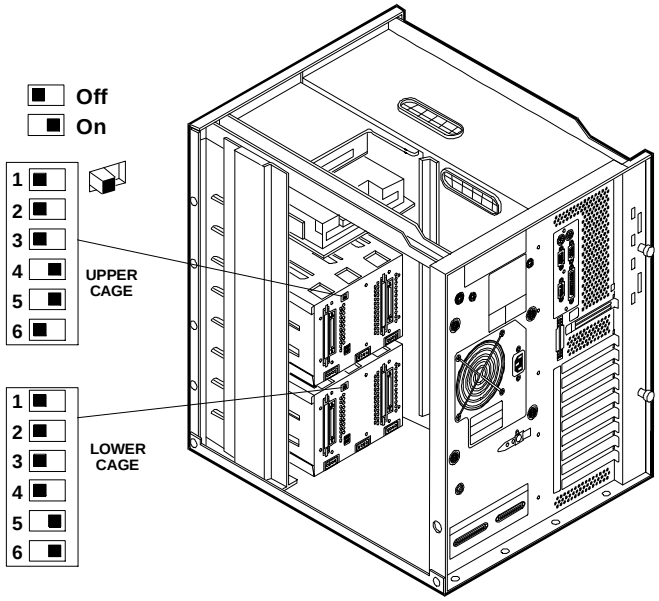


Default Switch Settings

These are the default SCSI address settings for this model. SCSI ID 2 is reserved for an added DAT (Digital Audio Tape) drive that can be installed in the upper horizontal Shelf 3. The CD-ROM drive is set for SCSI ID 5.

Configuring Switch Settings on the Hot Swap Subsystem

Switch setting combinations are given in the table below.



Switch	Function	Settings
1	I^2C Bus Setting	Always set to Off
2	I^2C Bus Setting	Always set to Off
3	High/Low Addresses	Always set to Off
4	SCSI Address Zero Sets middle shelf in cage to SCSI ID 0.	On: Sets middle shelf in the cage (shelf 2 or shelf 5) to SCSI ID 0. Off: Sets middle shelf to normal SCSI address sequence. See SCSI Address Settings table below for description of settings.
5	Remote Start Determines control of the hot swap disk module power-on sequence.	On: Internal control: Upper cage is set to delayed start and lower cage is set to power-on at startup. Off: Power-on sequence is determined by the disk array controller.
6	Upper/Lower Cage Identifies cage location. This is important information for the SCSI addresses and for the I^2C bus.	On: Lower cage Off: Upper cage See SCSI Address Settings table below for description of settings.

Hot Swap Subsystem SCSI Address Settings

Switches 4 and 6 determine the SCSI address setting for each shelf in the hot swap subsystem. The following table describes the settings and the resulting shelf SCSI address.

NOTE For information on changing the SCSI address setting on the CD-ROM drive, see the Technical Information Label on the CD-ROM drive.

Upper Cage		Lower Cage	
Switch Settings	**SCSI Address**	**Switch Settings**	**SCSI Address**
3 - Off 4 - Off 6 - Off	Shelf 1 = ID 1 Shelf 2 = ID 2 Shelf 3 = ID 3	3 - Off 4 - Off 6 - On	Shelf 4 = ID 4 Shelf 5 = ID 5 Shelf 6 = ID 6
3 - Off 4 - On 6 - Off	Shelf 1 = ID 1 Shelf 2 = ID 0 Shelf 3 = ID 3	3 - Off 4 - On 6 - On	Shelf 4 = ID 4 Shelf 5 = ID 0 Shelf 6 = ID 6

Specifications

Power Supply	Auto-ranging 90 to 132 VAC, or 180 to 264 VAC at 47-63Hz
Power Availability	LH/LH Plus 350W continuous, 386W peak LH Pro 450W continuous
Power Consumption	LH/LH Plus: 499/479W maximum with 110/220V supply 551/528W peak with 110/220V supply LH Pro: 650/600 maximum with 110/220V
System Dimensions	19.3 in. high x 13.7 in wide x 18.1 in deep (49 cm high x 34.8 cm wide x 46 cm deep)
System Weight	50-70 lbs (22.7-31.8 kg), depending on configuration
Operating Temperature	41 to 95 degrees F (5 to 35 degrees C)
Operating Humidity	20% to 80% non-condensing
BTUs	LH/LH Plus: less than 1700 BTUs (430 Kcal) LH Pro: less than 2200 BTUs (560 KCal)

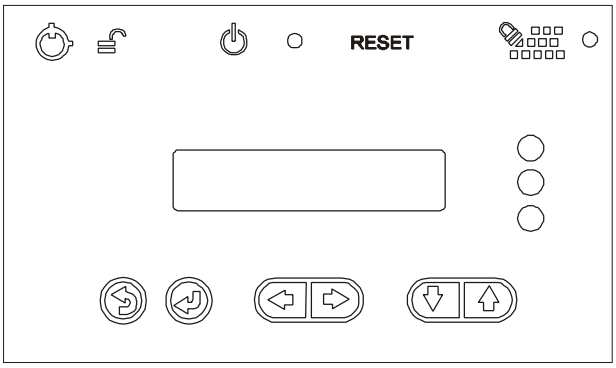
Front Control Panel



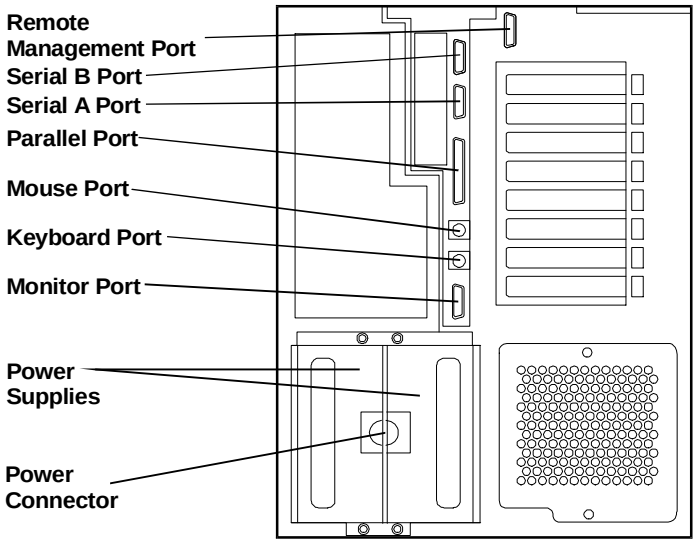
Control	Description
	Lock (LH 3 only) Locks system to prevent unauthorized use.
	DC Power Switchand indicator light Turns the NetServer on and off. This switch is behind the protective door on the front panel. Push once to turn on, again to turn off. (To disconnect the NetServer from AC power, remove the AC power cord from the power supply cage on the rear.)

Control	Description
RESET	Resets the NetServer from internal ROM. This switch is behind the protective door on the front panel.
	**Keyboard lockand indicator light** Locks system keyboard to prevent unauthorized use.
	**Status screen** Reports various types of system status. The buttons below the screen control these menu functions
	Return to a previous selection.
	Select a menu item.
	Reserved for future use.
	Scroll down or up.
	**Status LEDs** Indicates various types of system status: Green = Normal operation Yellow = Abnormal operation Red = Problem detected

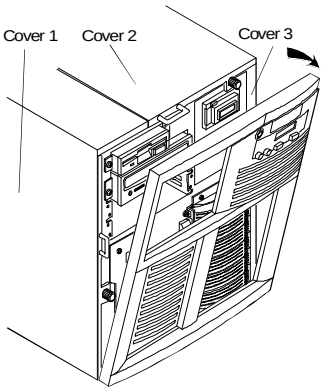
Front Panel Menu, as Shown on Status Screen

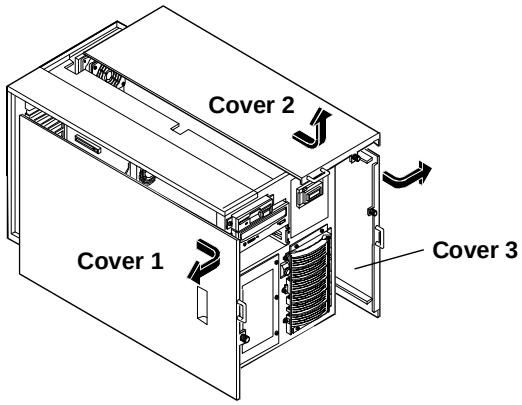
System Information	Reports system hardware details and software version numbers.
Field Replaceable Unit Information	Identifies part and revision numbers for components.
Contrast Adjustment	Use the arrow keys to change the LCD contrast for better readability.

Rear View

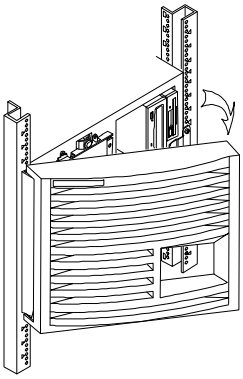


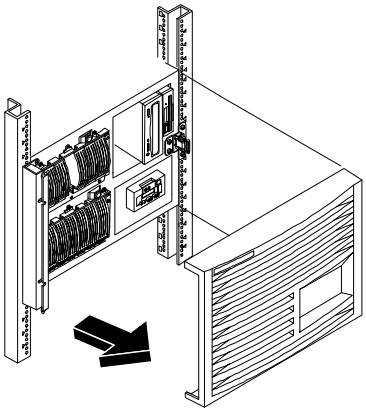
Covers (LH 3)

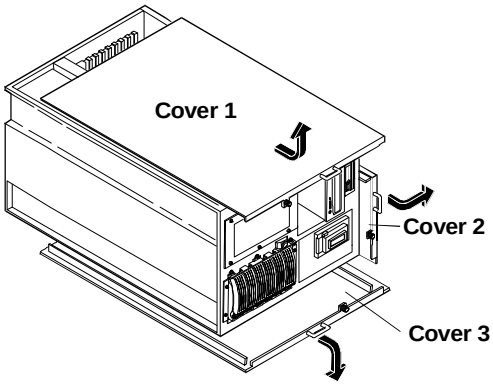




Covers (LH 3r)



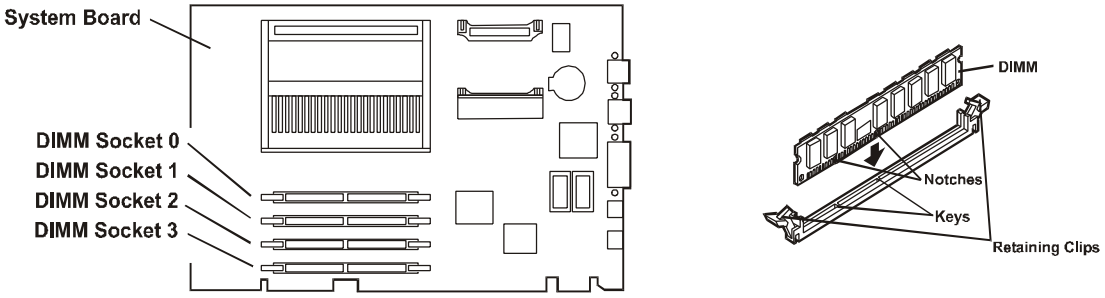




Memory

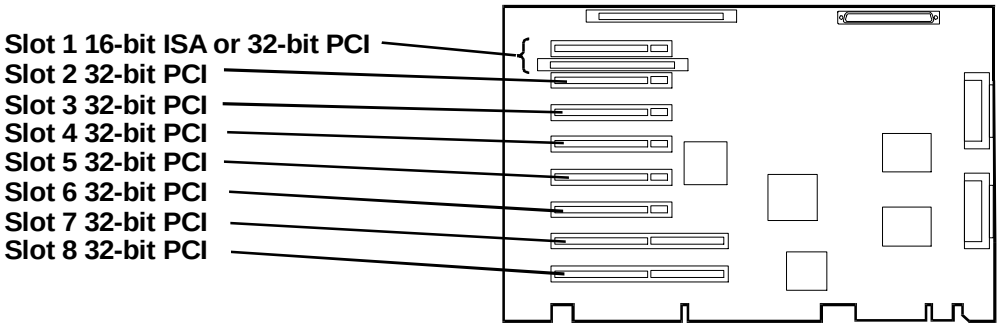
There are four DIMM sockets on the system board for memory expansion. You can use 64 MB, 128 MB, and 256 MB DIMMs for a maximum capacity of 1 GB of RAM.

- The minimum memory configuration for the NetServer LH 3/LH 3r is one 128 MB DIMM.
- The system board DIMM sockets are numbered from 0 to 3.
- DIMMs may be installed in any quantity and in any DIMM socket on the system board. DIMMs that differ in capacity can be mixed.



CAUTION	Do not rock the DIMM into place, but apply firm and even pressure directly downward. If the retaining clips do not close, remove the module and repeat Steps 3 through 5.

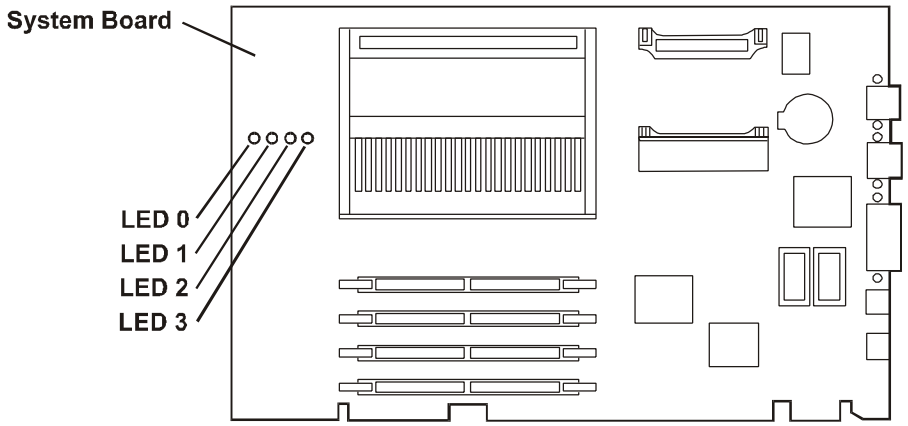
Boot Device Priority



Boot order for PCI controllers is determined by slot location. The system searches for a bootable device in the following order:

1. IDE CD-ROM drive with a bootable CD-ROM.
2. Flexible disk drive with a bootable flexible disk.
3. Embedded SCSI controller or embedded DAC.
4. PCI boards in slots in the following order: 8, 7, 6, 5, 4, 3, 2, 1.

DIMM Slot LED Blink Codes



LED Error Codes		
☼ = LED on ● = LED off Alternating Blink Code: LED 0 LED 1 LED 2 LED 3	Error Condition	Corrective Action
● ☼ ☼ ☼ ☼ ● ● ●	Primary VRM Failure	Check that primary voltage regulator module (VRM) is correctly seated. If problem persists, replace VRM.
☼ ● ☼ ☼ ● ☼ ● ●	Secondary VRM Failure	Check that secondary VRM is correctly seated. If problem persists, replace VRM.
● ☼ ☼ ● ☼ ● ● ☼	Processor Over-Temperature	Check fan for function. Turn off system, wait 20-25 minutes for system to cool, and restart system.
☼ ☼ ● ● ● ● ☼ ☼	Processor or Terminator Board Not Installed	Install processor in primary processor socket and a processor or terminator board in secondary processor socket.

DIMM Status Error Codes

When no processor error condition exists, each diagnostic LED display the status of the DIMM in the corresponding socket, as follows:

- OFF: no DIMM installed
- Flashes ON and OFF at 1 Hz in 50/50 proportion of time: defective or inappropriate DIMM
- Flashes ON and OFF at 1 Hz in 90/10 proportion of time: non-HP DIMM installed
- ON: HP DIMM installed

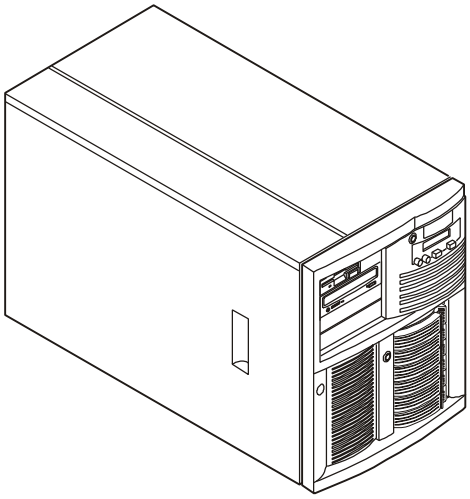
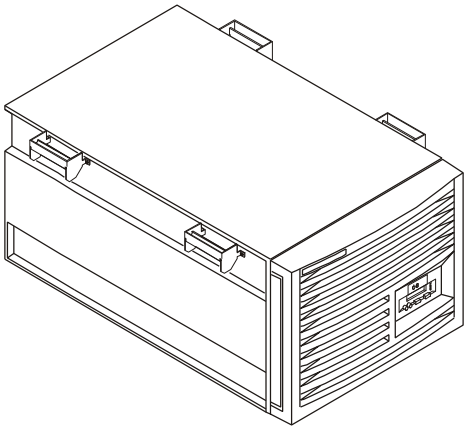
Width	482.6 mm (19 in)
Depth	749.2 mm (29.5 in)
Weight	35 - 50 kg (77 - 110 lb) **NOTE** A fully-loaded NetServer can weigh up to 160 pounds (73 kg). Follow local safety regulations, and use one person for every 40 pounds (18 kg) of NetServer weight when lifting it.
Power supply input voltage	Auto-Ranging Power Supply 100 to 127 VAC at 50/60 Hz 200 to 240 VAC at 50/60 Hz 90 to 132 VAC at 47 - 63 Hz 180 to 264 VAC at 47 - 63 Hz
Power supply output	550 W maximum (per module)
Sound pressure (LpA)	55 dB(A), bystander position

HP NetServer LH 4 and LH 4r System Information

System Views

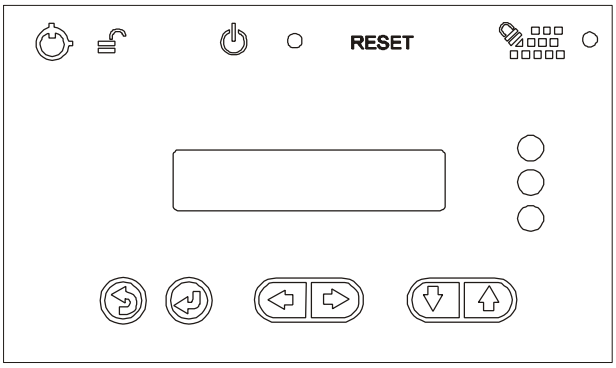


HP NetServer LH 4 (Pedestal)



HP NetServer LH 4r (Rack-Optimized)

Front Control Panel



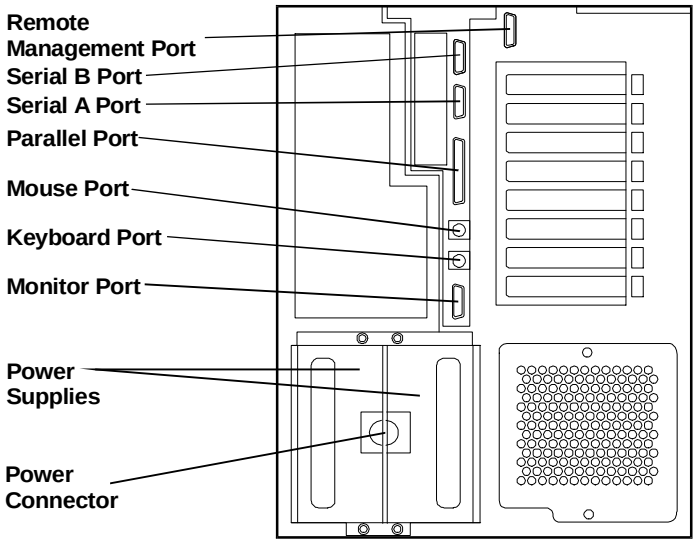
Control	Description
	Lock (LH 4 only) Locks system to prevent unauthorized use.
	DC Power Switchand indicator light Turns the NetServer on and off. This switch is behind the protective door on the front panel. Push once to turn on, again to turn off. (To disconnect the NetServer from AC power, remove the AC power cord from the power supply cage on the rear.)

Control	Description
RESET	Resets the NetServer from internal ROM. This switch is behind the protective door on the front panel.
	**Keyboard lockand indicator light** Locks system keyboard to prevent unauthorized use.
	**Status screen** Reports various types of system status. The buttons below the screen control these menu functions
	Return to a previous selection.
	Select a menu item.
	Reserved for future use.
	Scroll down or up.
	**Status LEDs** Indicates various types of system status: Green = Normal operation Yellow = Abnormal operation Red = Problem detected

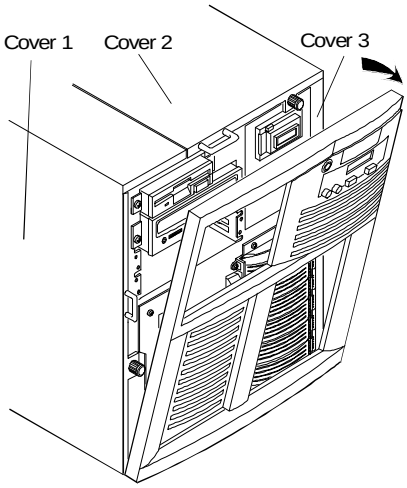
Front Panel Menu, as Shown on Status Screen

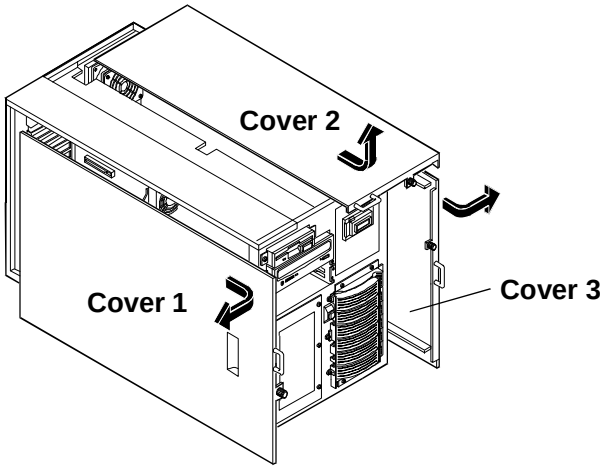
System Information	Reports system hardware details and software version numbers.
Field Replaceable Unit Information	Identifies part and revision numbers for components.
Contrast Adjustment	Use the arrow keys to change the LCD contrast for better readability.

Rear View

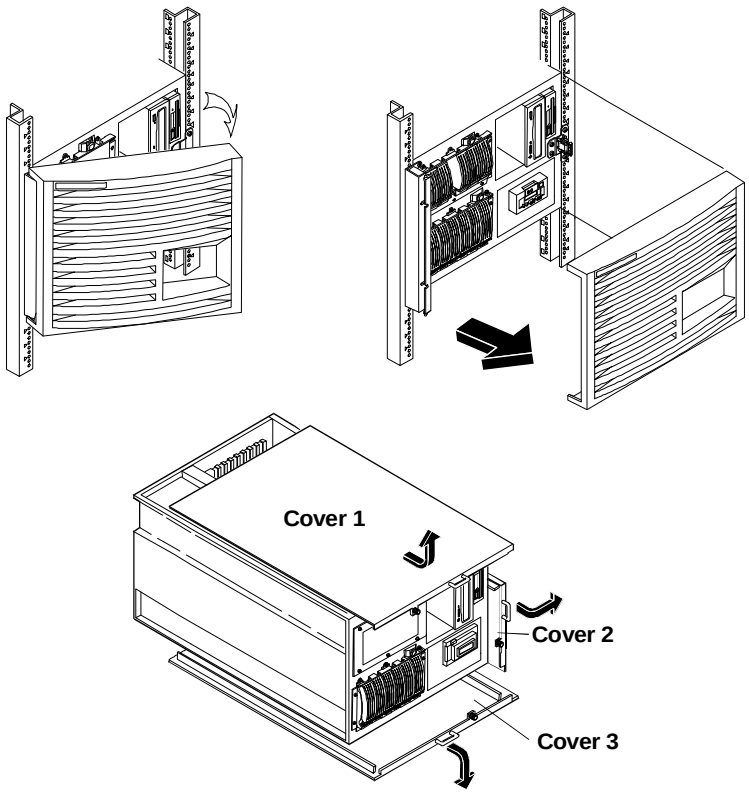


Covers (LH 4)





Covers (LH 4r)



Memory

The two memory boards (Memory A and Memory B) are located on the system board assembly, beneath the memory cage cover. Both memory boards are required. Each board has slots for eight DIMMs. The following rules must be observed when adding memory:

DIMMs are added four at a time - two per memory card. The memory cards must be balanced.

DIMMs are installed in banks, 1 through 4.

J1 and J2 of Memory A and B are bank 1

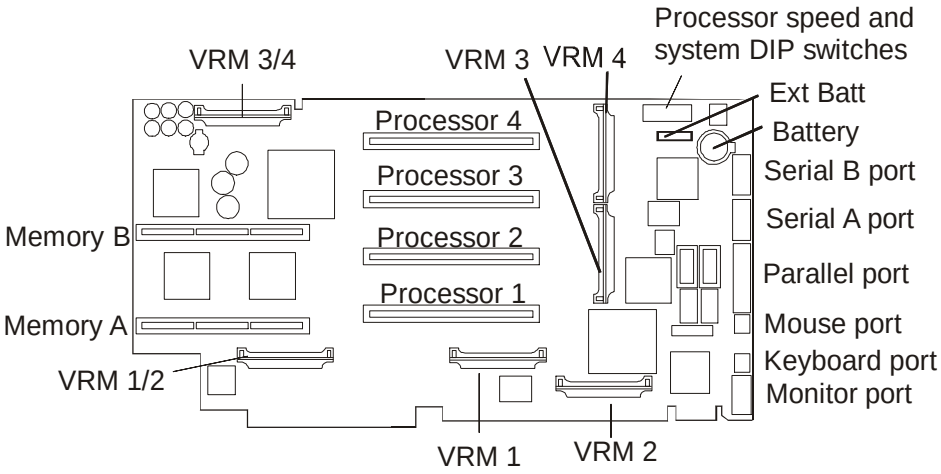
J3 and J4 of Memory A and B are bank 2

J5 and J6 of Memory A and B are bank 3

J7 and J8 of Memory A and B are bank 4

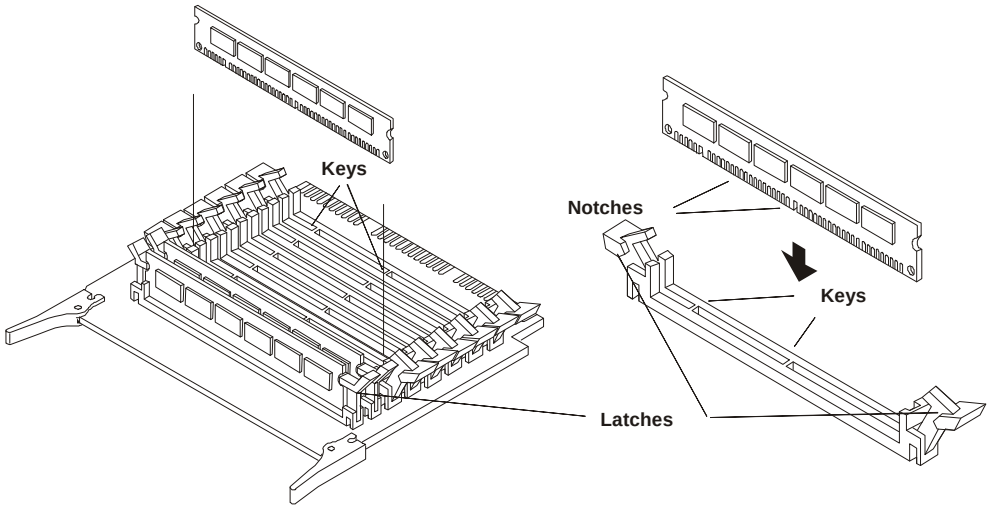
DIMMs must be 64 or 256 Mbytes, EDO buffered TSOP 50 ns.

DIMM types cannot be mixed in a bank.



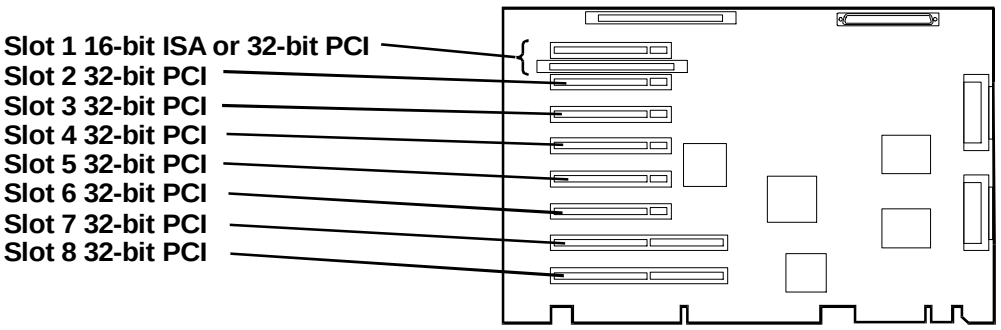
Note: Processor slots without processors have terminators.

NOTE	Use only HP DIMMs listed in HP Information Assistant or HP Order Assistant.



CAUTION	Do not rock the DIMM into place, but apply firm and even pressure directly downward. If the retaining clips do not close, remove the module and repeat Steps 3 through 5.

Boot Device Priority



The Boot Device Ordering submenu contains the following options:

- **Floppy check:** Enables or disables verification of flexible disk drive type during boot
- **Summary screen:** Enables or disables display of a screen of system configuration information.
- **Boot Device Priority:** Allows you to rearrange the following default order in which drive types are searched for the operating system:
  - ◊ CD-ROM drive with bootable CD-ROM
  - ◊ Flexible Disk with bootable flexible disk
  - ◊ Hard Drive
- **Hard Drive Priority:** Allows you to rearrange the order in which hard disk drives are searched for the operating system. All hard disk drives in the system are listed, as well as any bootable ISA board.

  Boot order for PCI controllers is determined by slot location. The system searches for a bootable device in the following order:
  1. IDE CD-ROM drive with a bootable CD-ROM.
  2. Flexible disk drive with a bootable flexible disk.
  3. Embedded SCSI controller or embedded DAC.
  4. PCI boards in slots in the following order: 8, 7, 6, 5, 4, 3, 2, 1.

Specifications

Temperature

Operating	5° to 35° C (41° to 95° F)
Non-operating	-40° to +65° C (-40° to +149° F)

Humidity (noncondensing)

Operating	20% to 80% relative humidity, non-condensing
Non-operating	5% to 95% relative humidity, non-condensing

Altitude

Operating	-30 to 3,000 m (~10,000 ft)
Non-operating	-30 to 12,000 m (~40,000 ft)

Minimum Clearance

Front	1 m (39 in)
Sides	2.5 cm (1.0 in)
Top	2.5 cm (1.0 in)
Back	15 cm (6.0 in)

Weight and Dimensions - LH 4

NOTE A fully-loaded NetServer can weigh up to 160 pounds (73 kg). Follow local safety regulations, and use one person for every 40 pounds (18 kg) of NetServer weight when lifting it.

Height	494.8 mm (19.5 in)
Width	350.5 mm (13.8 in)
Depth	724.2 mm (28.5 in)
Weight	35 - 50 kg (77 - 110 lb)

Weight and Dimensions - LH 4r

Height	354.7 mm (14 in)
Width	482.6 mm (19 in)
Depth	749.2 mm (29.5 in)
Weight	36 - 60 kg (79 - 132 lb)

Power Supply

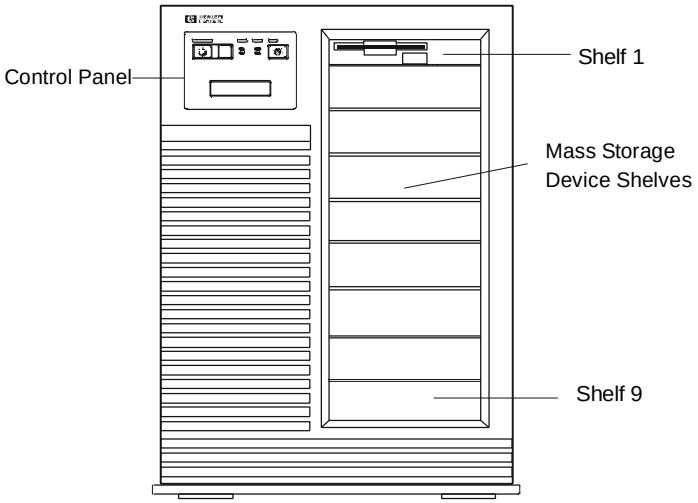
Power supply input voltage	Auto-Ranging Power Supply 100 to 127 VAC at 50/60 Hz 200 to 240 VAC at 50/60 Hz 90 to 132 VAC at 47 - 63 Hz 180 to 264 VAC at 47 - 63 Hz
Power supply output	810 W maximum
Power consumption	1213W / 1180W with 110V/220V input voltage

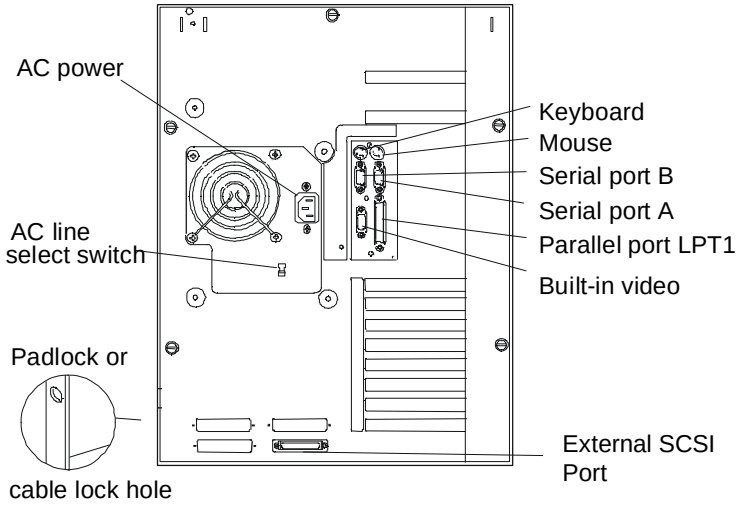
Acoustic Emissions

Sound pressure (LpA)	<55 dB(A), bystander position

System Views

Front and Rear Views





NOTE:	The server was pre-set at the factory for the AC line voltage in each supported country. If the AC voltage is between 100-127 VAC, the AC line select switch should be set at the 115 V position. If the AC voltage is between 200-240 VAC, the AC line select switch should be set at the 230 V position.

Parts List

NOTE The part numbers in the list were the ones that were available at the time of publication. Part numbers may change after publication. HP's parts price list database will generally contain a reference to the revised part number. If a system board needs to be replaced, any video DRAM chips, memory modules, processor board, any added accessory boards, and keep them with the server under repair.

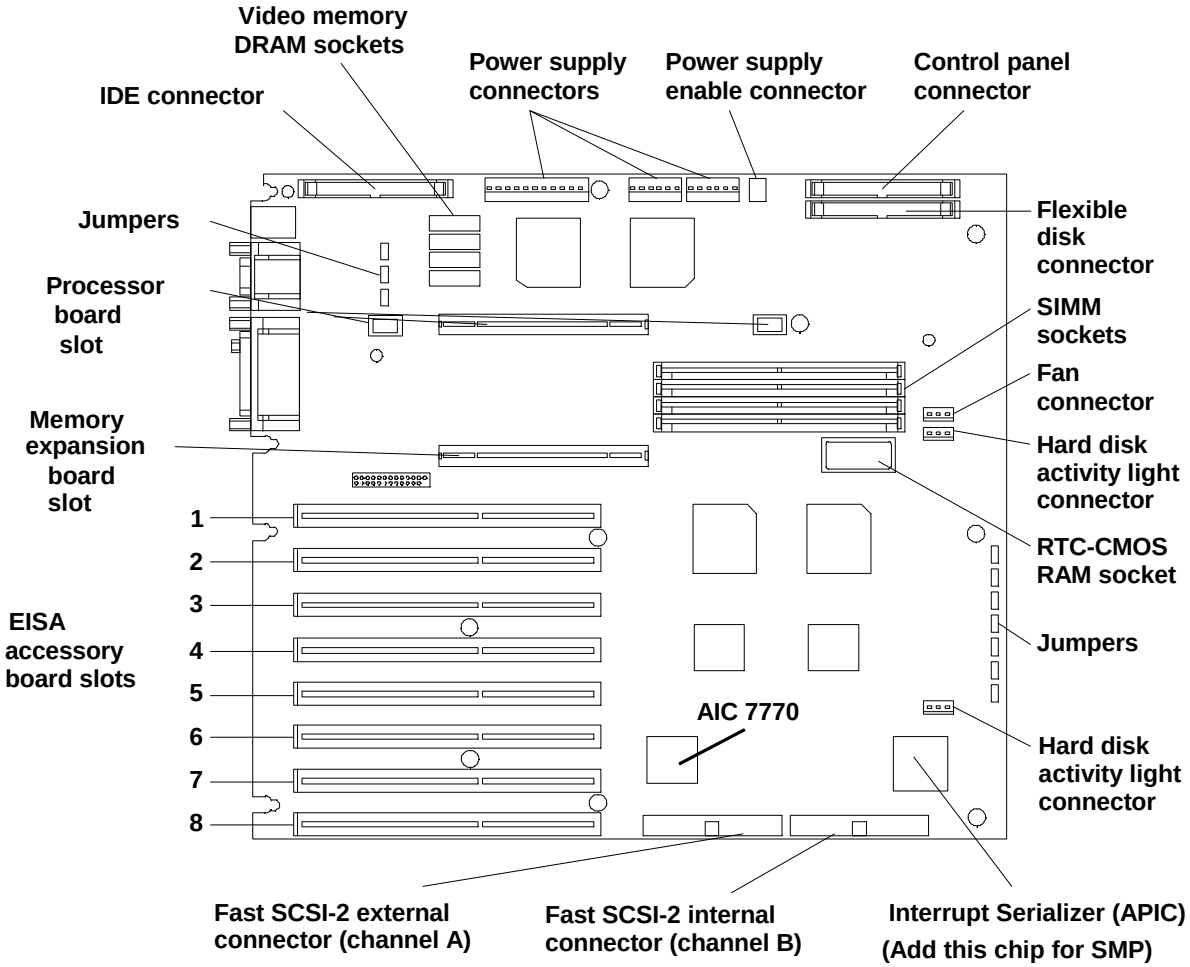
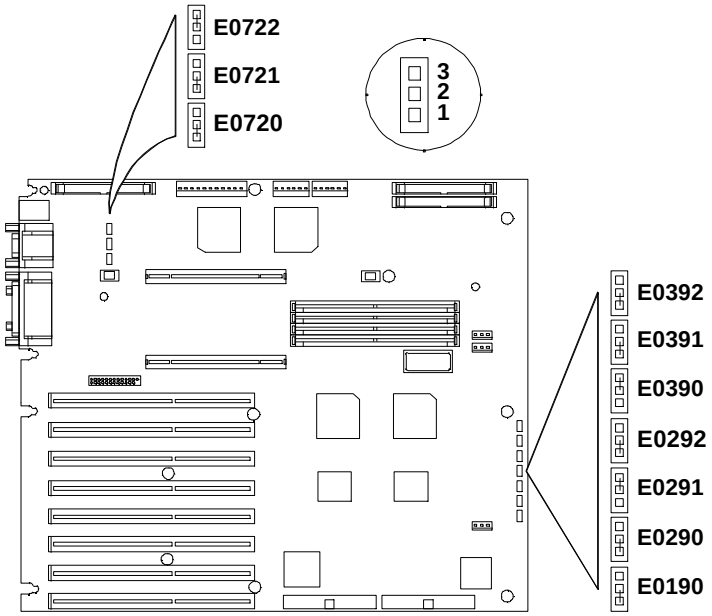
System Board



System Board Jumper Locations



System Board Jumper Settings

Jumper	Function	Default
E0190	**Flash BOOT**. When the jumper is on pins 1 and 2, the Flash ROM can be reflashed. If the Flash ROM is corrupt, even reading from the flexible disk drive does not work, move the jumper to 2-3 to allow access to protected code on the Flash EPROM (boot code protected sector) that should allow the Flash from the BIOS.	1 to 2
E0290	**VGA**. When the jumper is on pins 2 and 3, the built-in video is disabled. Disable the built-in video only if a separate video board is installed in the server.	1 to 2
E0291	**Floppy R/W**. When the jumper is on pins 1 and 2, it disables writing to flexible disk drives.	2 to 3
E0292	**NVRAM Clr**. When the jumper is on pins 2 and 3, it erases the current system configuration from NVRAM. The jumper must be on pins 1 and 2 to run the EISA Configuration Utility to reconfigure the server.	1 to 2
E0390	**Password**. When the jumper is on pins 1 and 2, it erases the current power-on password from CMOS. The jumper must be on pins 2 and 3 to use the power-on password.	2 to 3
E0391	**SIMM0 Std**. When the jumper is on pins 1 and 2, memory bank 0 is compatible with 4 MB and 8 MB SIMMs. When the jumper is on pins 2 and 3, memory bank 0 is compatible with 16 MB and 32 MB SIMMs.	1 to 2
E0392	**SIMM1 Std**. When the jumper is on pins 1 and 2, memory bank 1 is compatible with 4 MB and 8 MB SIMMs. When the jumper is on pins 2 and 3, memory bank 1 is compatible with 16 MB and 32 MB SIMMs.	1 to 2

Jumper	Function	Default
E0720	**VID1**. When the jumper is on pins 2 and 3, it allows four 256 KB x 4-bit DRAMs to be installed in the DRAM sockets for a total of 1 MB of video memory. When the jumper is on pins 1 and 2, it selects 512 KB of onboard video memory.	1 to 2
E0721	**Lock Config.** When the jumper is on pins 2 and 3, it prevents the current system configuration maintained in the Flash BIOS from being changed.	1 to 2
E0722	**3C3VID**. When the jumper is on pins 1 and 2, it changes the starting address of the I/O registers to 46E8H from 03C3H.	1 to 2

NOTE Leave the BIOS Jumper DISABLED. The server stores its system information (BIOS), built-in diagnostics, and other utilities on an erasable, programmable ROM (EPROM) chip. The EPROM chip allows you to update this information from a diskette. An update diskette will contain complete instructions. Leave the BIOS jumper in the DISABLED position unless the HPUpdate Utility instructions direct you to change the jumper to its ENABLED position. This jumper helps prevent any destructive programs (viruses) from writing to the programmable ROM. After you complete the BIOS update, always return the jumper to the DISABLED position.

Memory

- The server supports 4 MB and 8 MB (70 ns or 80 ns) (no 60 ns SIMMs). NEC or Mitsubishi SIMMs can only be 70 ns.
- For 16 MB and 32 MB SIMMs, speed must be 60 or 70 ns (no 80 ns SIMMs).
- You must install memory modules in pairs (called banks) of matching size and speed; however, the banks can be of different sizes and speeds.
- If you install a pair of 16 MB or 32 MB memory modules, you must move the jumper for the corresponding bank to the 2-3 position (Jumpers E0390, E0391, E0392).

Video Memory - DRAM

The video has 512 KB of RAM that allows pixel resolutions of 640 x 480 in 16 colors. You can upgrade the server from 512 KB to 1 MB by installing four, 256 KB x 4 bit, 60 ns DRAMs in the four empty DRAM sockets.

NOTE Only DRAMs from certain manufacturers have been tested for compatibility with the HP NetServer LM Series. Hewlett-Packard does not supply the DRAM upgrade. Consult the HP PC Bulletin Board Service at 1-408-553-3500 for a current list of supported DRAM upgrades.

Recommended Video DRAM Vendors

Vendor	DRAM Part Number
Fujitsu	MB81C4256AP-60
Hitachi	HM51425HP-6
NEC	uP0424256C-60
Samsung	KM44C256BP-6

Intel	P21014-06
Toshiba	TC514256Ap-60
Texas Instruments	TMS44C256N-60

To take advantage of the upgrade, you must also install the appropriate drivers. Consult the HP PC bulletin board for a list of the required drivers. Hewlett-Packard does not supply or support the drivers.

CAUTION	Apply *gentle* pressure on the pins. They can bend easily. If a pin does not align with a hole, carefully use needle-nose pliers to straighten the pin.

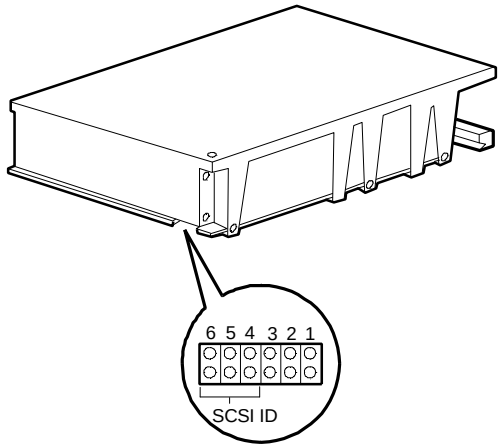
When you reboot the server, the system BIOS shows the video memory size during the Power-On Self-Test (POST) to verify that the additional video memory DRAM is installed correctly. If the video display does not work when you power up the server, remove the upgrade video DRAMs and check the chips for bent pins.

HP NetServer LM System Updates

These notes reflect changes for the HP NetServer LM which could not be included with the service manual or were changed at a later date. Service manuals are not updated and the information, if any, in this section is the latest information available. See also the HP NetServer LM Update, HP Part No. D2332-90009, for additional information on operating systems.

Factory Installed SCSI Hard Drive

Some LM models have a factory installed SCSI hard disk drive. The SCSI hard disk drive has a set of mode select switches located on the rear of the drive. Switches 1, 2, and 3 are not customer adjustable, and factory settings should not be changed. The SCSI hard disk drive comes with the SCSI address set for ID 0.



SCSI Hard Disk Drive ID Jumper Settings

	Jumper 6	Jumper 5	Jumper 4
ID 0			
ID 1			Jumper
ID 2		Jumper	
ID 3		Jumper	Jumper
ID 4	Jumper		
ID 5	Jumper		Jumper

ID 6	Jumper	Jumper	
ID 7	Not functional		

1740 SCSI Host Adapter Configuration

Configuring a 1740 SCSI adapter (either the HP D2649A or D1681A) may cause a "Shadow RAM diagnostic failed" error message.

The SCSI BIOS uses the last 128 bytes of the 32 KB ROM space as a RAM buffer. In the 1740's .CFG file, there is a "WRITABLE" parameter under each BIOS address option. This parameter can be set to either "YES" or "NO."

To configure the 1740, the "WRITABLE" parameter for the ROM address of where the SCSI BIOS is configured must be set to "YES." Otherwise, the server will not treat that address area as a writable memory area.

You can use any text editor to edit the "WRITABLE" parameter in the following .CFG file:

1740 (D1681A):	!ADP0000.CFG
1740A (D1681A or D2649A):	!ADP0001.CFG

For example, if you are going to use the D0000H area for the SCSI BIOS, perform the following:

1.Find the line that looks like: CHOICE="BIOS Base Address D0000H."

2.Set the "WRITABLE" parameter to "YES."

3.Save the .CFG file, and rerun EISA Config with the new .CFG file.

Selecting Primary SCSI Channel

Starting with the HP *NetServer #1* diskette, version F.01.00, you may select Channel A (external) or Channel B (internal) to be the primary SCSI channel. The system first looks for the boot drive on the primary channel; if one is not found, it then looks on the secondary channel.

SCSI BIOS Address and Boot Device

A system will always boot from the device that is connected to the SCSI adapter with the lowest BIOS address. The lowest BIOS address option for a 1740 Adapter (either the HP D2649A or D1681A) is C8000H, and for a 2740 Adapter (HP D2078A) it is CC000H. For example, if a system uses both a 7770 and a 1740 controller and you want to boot from a device on the 1740, then the video must be shadowed to C0000H. That will put the 7770's BIOS at E0000H, which will always be a higher address than the 1740's BIOS.

Installing Four or More Disk Drives on One SCSI Channel

If you want to connect four or more SCSI drives on the same SCSI channel, you may have excessive spin-up delays in your system. This could result in the SCSI drives with higher addresses not being recognized by the network operating system (NOS).

The default configuration of the HP SCSI 535 MB, 1 GB, and 2 GB hard disk drives has the delayed spin-up feature enabled. The number of seconds the drive waits before spinning up after Power On is related to the drive's SCSI address: the higher the address, the longer the delay. This feature controls the power demand imposed by numerous drives spinning up simultaneously after Power On.

In general, when selecting an address for drives (default address is 0), select the lowest SCSI address possible.

When installing the first three drives in an HP system, only use addresses 0, 1, and 2 and leave the Delayed Spin-Up jumper in place (default setting).

If more than three drives are installed, remove the Delayed Spin-Up jumper on drives with addresses 3, 4, 5, and 6. To find the Delayed Spin-Up jumper, orient the drive so the circuit board is on top and the power/SCSI connector is facing away from you. The jumper block is two-thirds of the way up the right edge of the circuit board. The jumper is in position 2 from the front of the drive and is labeled "DS" (refer to the "Technical Information" section in the hard disk *Installation Guide*).

The result of this procedure is that several drives will spin up simultaneously. This may draw more current than the power supply can provide. If the system crashes due to a power supply failure, replace the jumpers and command the NOS to wait until the drives are initialized before initializing the network. The spin-up delay is the SCSI address multiplied by 15 seconds. This means that the drive at SCSI address 5 delays 75 seconds (5 x 15 seconds) before initializing. The NOS must wait at least as long as the drive with the longest delay so that it can recognize the drives.

You may also reboot (push the reset button) after a Power On if the system completed its boot sequence before the last drive has spun up.

Boot Problem with Greater than 2 GB HP Disk Array Boot Drive

An array with total capacity greater than 2 GB, such as 3 or 4 drives, may have a boot error while booting the system. This is a BIOS limitation and can occur with any NOS or OS.

If you have more than 2 GB total capacity, you must make the first logical partition less than or equal to 2 GB. Create the other partitions with the remaining capacity. Use the DOS utility for the Disk Array called JETSET.EXE.

For example, if you are loading NetWare, which needs to first boot to DOS, create a small DOS partition (for example, 50 MB) for the first partition in JetSet and then create a second large partition with the remaining capacity.

HP C2260A Storage System and the Built-in SCSI Connector

The server has a built-in SCSI connector (in the back of the unit) which is a Fast SCSI-2 port. The HP C2260A Storage System is not compatible with Fast SCSI-2, and has not been supported on this SCSI connector.

To connect an HP Storage System to the embedded Fast SCSI-2 subsystem, use the HP Fast SCSI-2 Kit (C3607A). The kit contains an active terminator, driver software, and installation instructions to support the HP Storage System on the embedded Fast SCSI-2 subsystem.

Disk Array Controller

Use the EISA Array Controller Card shipped with the Disk Array. This card provides the data protection and hot-spare capabilities of the HP Disk Array. **Do not use the Disk Array storage cabinet with any other controller cards, including the controller integrated server.**

IDE 240 MB (D1697A) or 270 MB (D2894A) Hard Disk Installation and Configuration

If you are installing one or two HP D1697A 240 MB IDE or HP D2894A 270 MB IDE hard disk drives using the IDE hard disk drive cable (P/N 5182-0016), follow these steps:

1. Connect the first (or only) hard disk to the connector labeled "PRIMARY" on the IDE hard disk drive cable.
2. Configure the primary drive to be the master drive by moving the IDE disk drive jumper from the CS position to the DS (master) position. The master drive is usually the first drive, but either drive can be the master.
3. Connect the second disk drive to the connector labeled "SECONDARY" on the IDE hard disk drive cable (P/N 5182-0016) and remove the jumper completely.

In the EISA Configuration Utility, select the *Hard Drive 1* (or *2*) to be Drive Type 2 or 48 (User Definable) at the end of the list of choices for any IDE hard disk drives installed. Do not use Hard Disk Auto Configuration. Verify these parameters as the drive definition:

Parameter	240 MB	270 MB
Cylinders:	723	944
Heads:	13	14
Sectors:	51	40
Precomp:	-1	-1
Landing Zone:	722	943

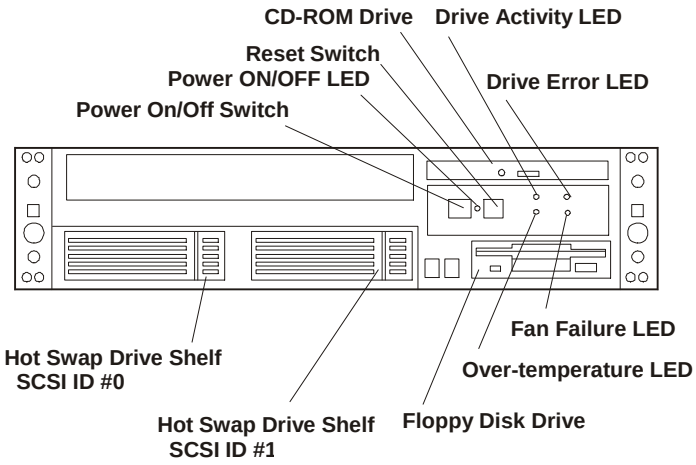
Change the setting of "Posted I/O Writes" to Disabled. If the setting is Enabled, the drive operates very slowly.

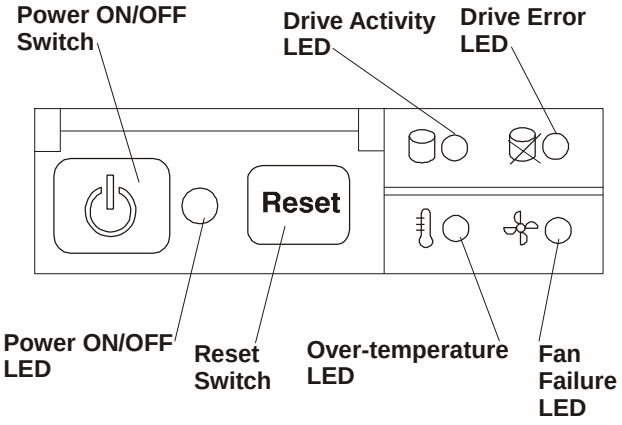
Specifications

Power Supply	Power select switch: 90 to 132 VAC, or 198 to 264 VAC at 47-63Hz
Power Availability	386W continuous, 458W peak
Power Consumption	551/529W maximum with 110/220V supply 654/627W peak with 110/220V supply
System Dimensions	19.3 in. high x 13.7 in wide x 18.1 in deep (49 cm high x 34.8 cm wide x 46 cm deep)
System Weight	50-70 lbs (22.7-31.8 kg), depending on configuration
Operating Temperature	41 to 95 degrees F (5 to 35 degrees C)
Operating Humidity	20% to 80% non-condensing

System Views

Front Panel Controls

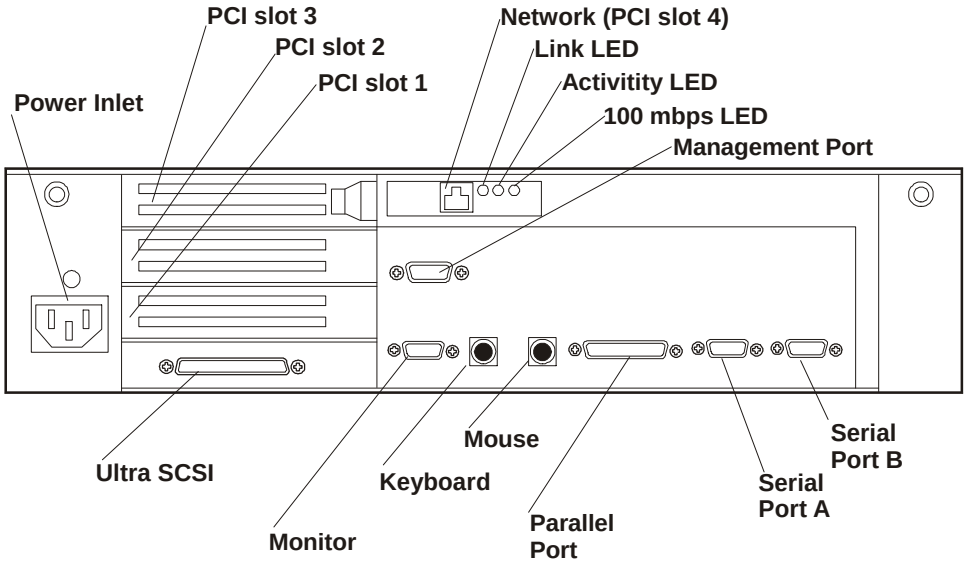




Control / Indicator	Description / Definition
Power On/Off Switch 	Momentary switch. When pressed, moves power status back and forth between System Power and Standby Power. System Power allows full system operation; Standby Power enables remote system monitoring only.
Power On/Off LED 	*Green* when System Power on. If this LED does not come on, the system is not getting adequate power or the power supply is malfunctioning.
Reset Switch 	Momentary switch. When pressed, creates hard system reset. This is equivalent to a power-on reset.

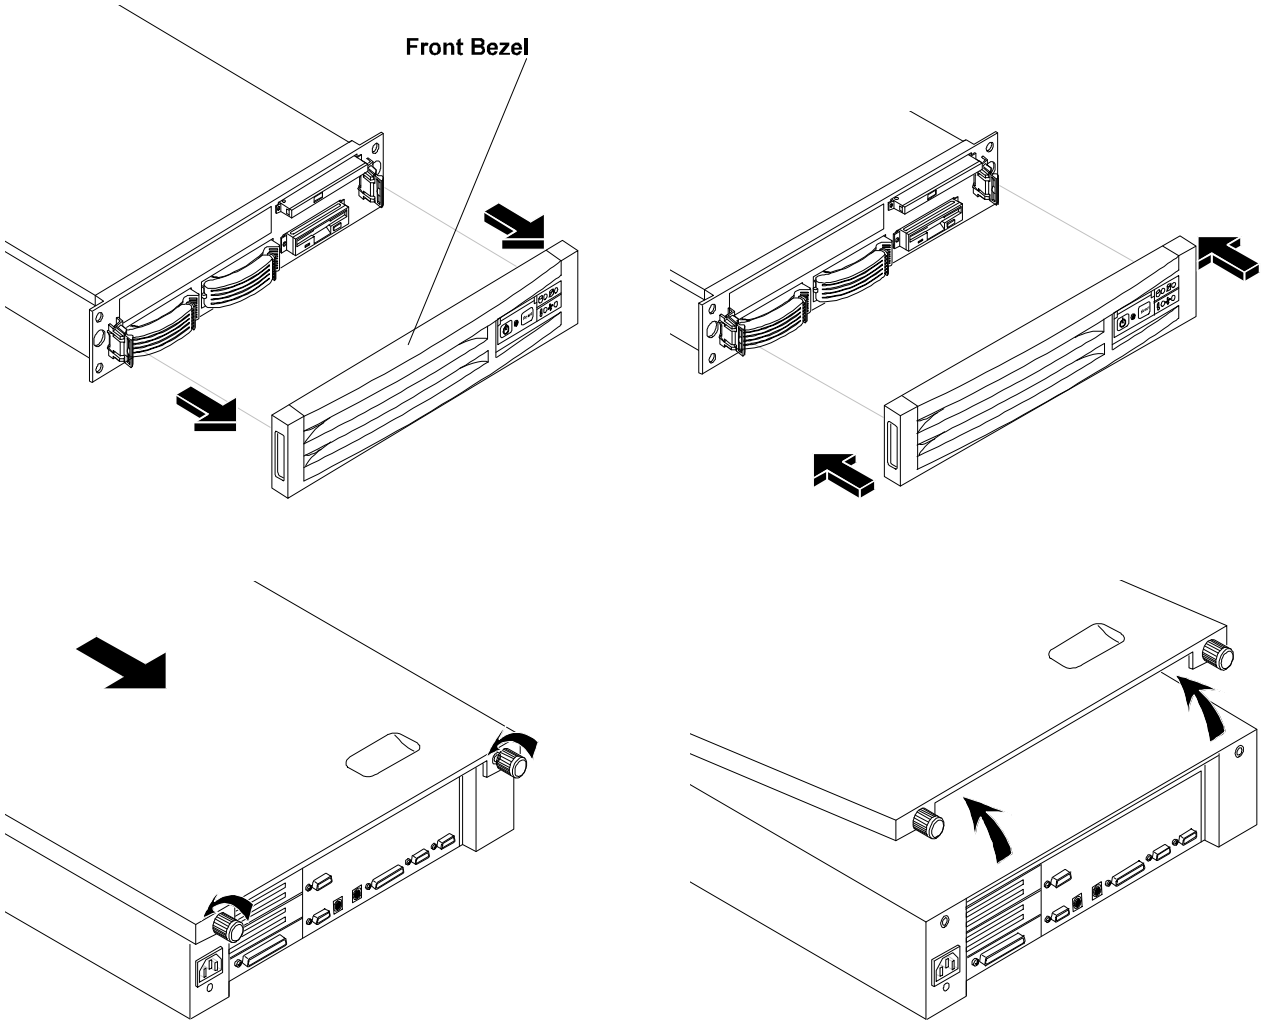
Drive Active LED 	LED goes on (*green*) to indicate access over the LPr's embedded SCSI bus. This includes access to both internal and external drives.
Drive Error LED 	LED flashes *red* to indicate that one of the two drives in the hot-swap bays has failed and must be replaced. LED flashes *yellow* to indicate that one of the two drives is predicted to fail and should be replaced. You may have time to back up the drive before replacing it. **NOTE**: You may have to remove the front bezel to see the specific drive LEDs and determine which device is in trouble.
Over-Temperature LED 	LED flashes *red* when any one of several temperature sensors within the LPr indicates damage to the system is imminent. Power down the system immediately. LED flashes *yellow* to indicate internal temperature is nearing damaging levels. Perform a graceful shutdown and power down the system.
Fan Failure LED 	LED flashes *red* to indicate a fan failure. Power down the system immediately. LED flashes *yellow* to indicate a fan is a lower than normal speed. Unless the over -temperature indicator is flashing *red* or *yellow*, you may perform a graceful shutdown and then power down the system and correct the fan problem. This indicator reports on the power supply fan as well as the three fans in the internal LPr fan pack.

Rear Panel Controls, Ports, and Indicators



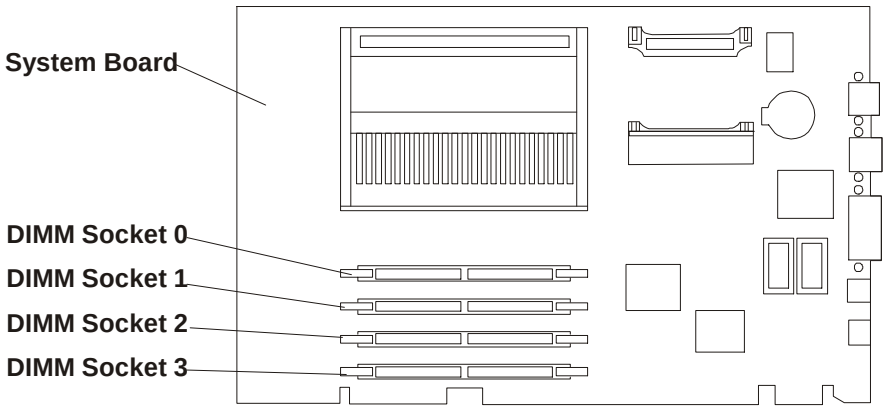
Indicator	Definition
Link LED	This LED goes on to indicate that both the network adapter in the LPr and the network switch are receiving power and that they are properly connected.
Activity LED	This LED flashes to indicate data transfers to/from the LPr network adapter. The rate of flashes varies directly with network traffic.
100 mbps LED	This LED goes on to indicate that the LPr network adapter is supporting transfers at the 100 mbps (million bits per second) rate. When off, the LPR is working at 20 mbps.

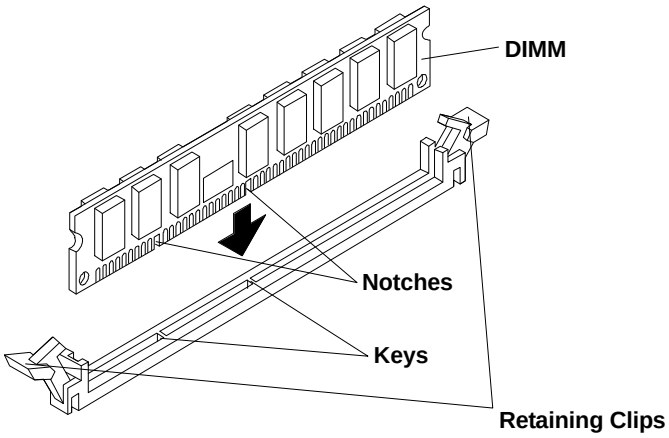
Covers



Memory

The NetServer LPr's main memory is implemented with 5V SDRAM DIMMs (Dual In-Line Memory Modules). The NetServer LPr ships with at least 64 MB of main memory and supports up to 1 GB. Memory is available in the following DIMM capacities: 64, 128, and 256 MB. There are four DIMM sockets on the system board. DIMMs may be installed in any combination in any socket. However, we recommend starting at socket 0 and filling the sockets in numerical order: 1, 2, and 3. Use only HP DIMMs.

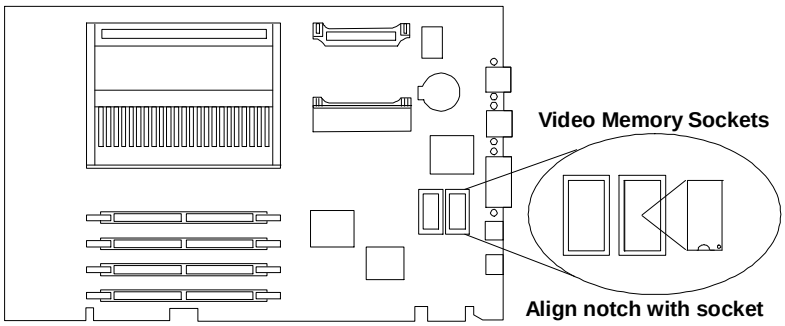




Video Memory

The HP NetServer LPr comes standard with a 1 MB frame buffer to support video displays of 1024 (horizontal pixels) x768 (vertical lines) x 256 (colors per pixel) at refresh rates up to 72 Hz. You can upgrade the frame buffer to 2 MB to support 1280 x 1024 by adding two memory chips.

NOTE The video memory chips must be installed in pairs. To get a higher resolution display, you may have to load additional video drivers for the operating system. Refer to the instructions that accompanied the video memory upgrade kit as well as your NOS documentation.



Boot Device Priority

By default, the HP NetServer searches for bootable devices in the order shown below. CD-ROM Drive

Floppy Disk Drive

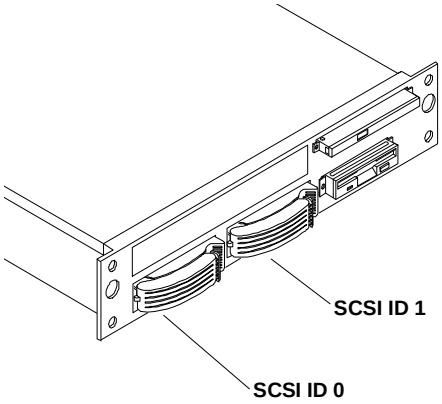
Embedded SCSI Controller, starting with SCSI ID 0

PCI Slots in the order 3, 2, and 1

On each controller, the server scans for a boot device starting at device ID 0 and works up from there. The controller is always SCSI ID 7.

NOTE	This boot order can be changed using the SETUP utility (press [F2] during the boot process).

Hot-Swap Drive Bay Addresses



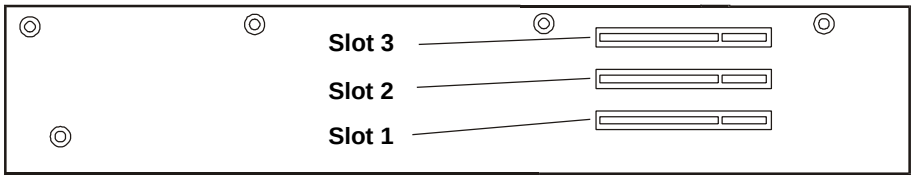
Accessory Boards

The HP NetServer LPr includes four PCI slots; one (over the system board) is taken by the Network Interface Controller (NIC) but can be used by other small PCI boards.

Interrupt Sharing

In the LPr, PCI slot #3 and the embedded SCSI controller share the same interrupt line. The system is capable of avoiding internal conflicts through interrupt sharing; however, interrupt sharing results in a small performance loss as the operating system has to resolve which of the devices caused the interrupt before it responds. Therefore, if the embedded SCSI controller is enabled, use the other PCI slots before using slot #3.

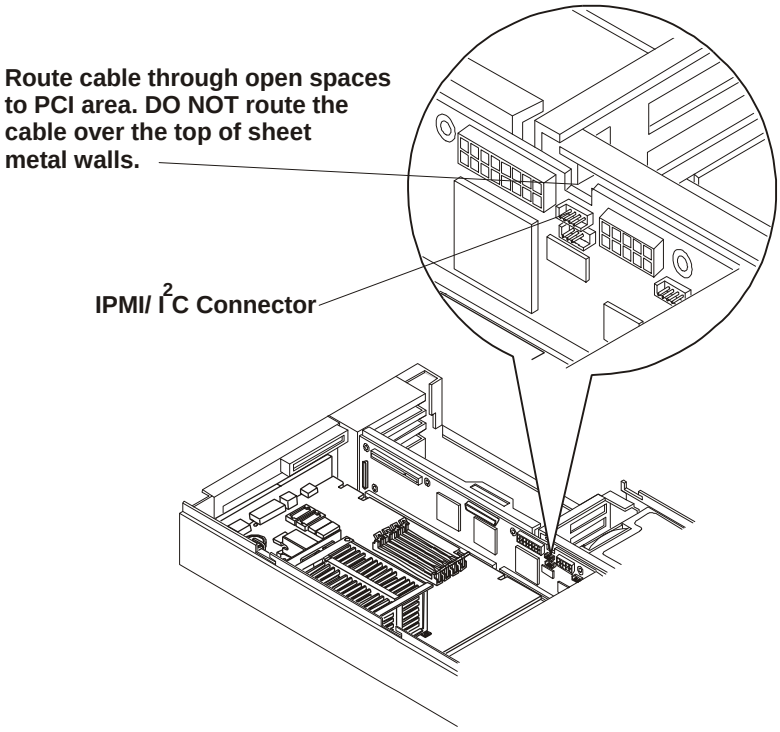
NOTE	Adding a PCI-to-PCI bridge card to the HP NetServer may alter the server's boot order. This boot order can be changed using the SETUP utility (press [F2] during the boot process). Refer to Chapter 4, "Installing Mass Storage Devices," and see the subsection, "Boot Device Priority."



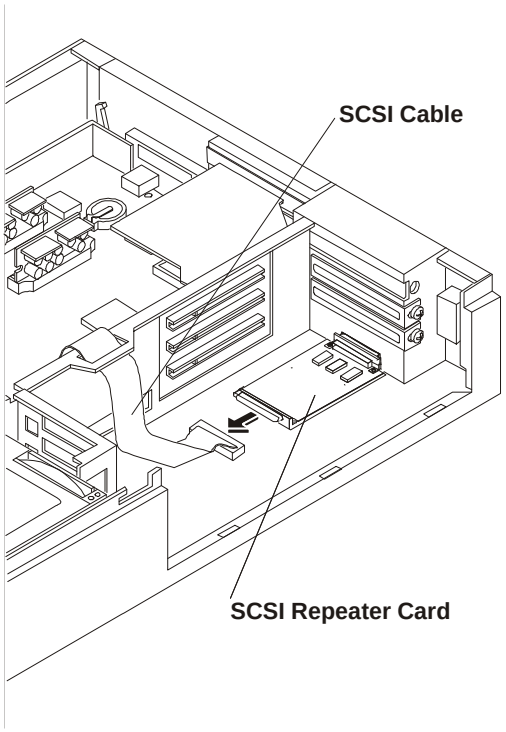
CAUTION	Do not bend the PCI card to fit it into the slot. Check to make sure you removed any handles or board extenders.

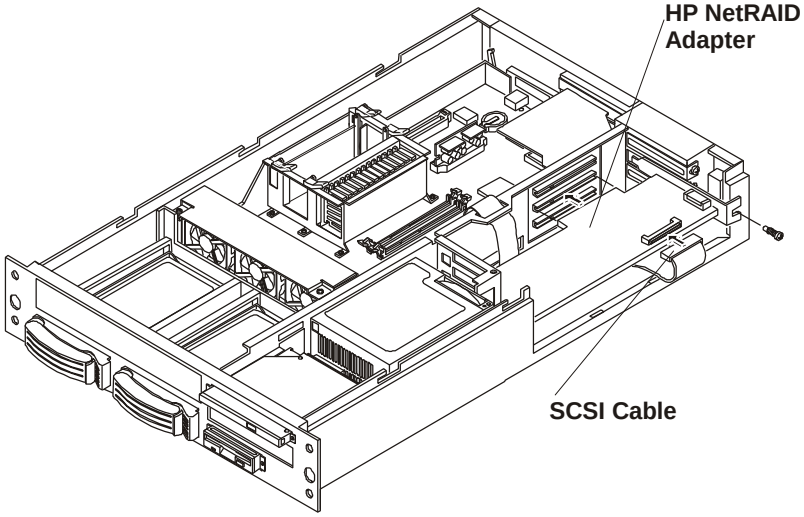
Remote Control Card

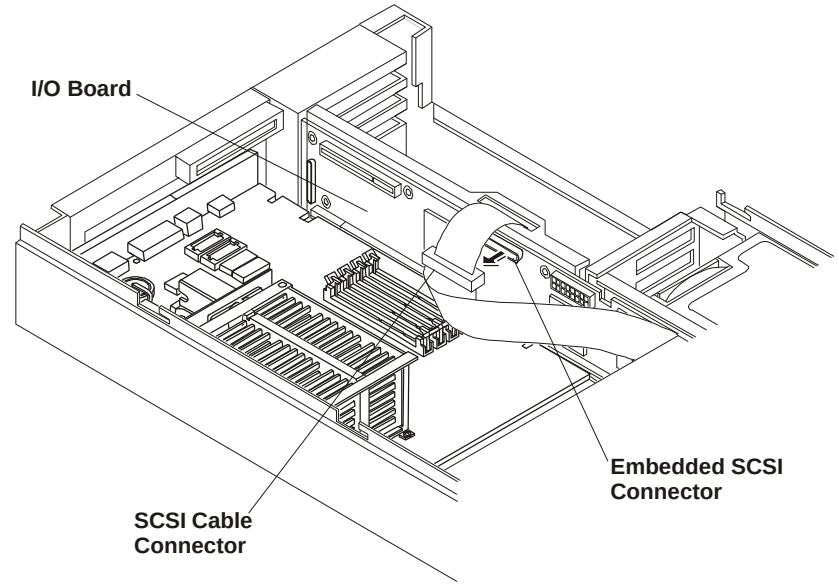
Refer to the *Top Tools Administration Guide for Remote Control* along with the upgrade kit documentation for information on the remote control card.

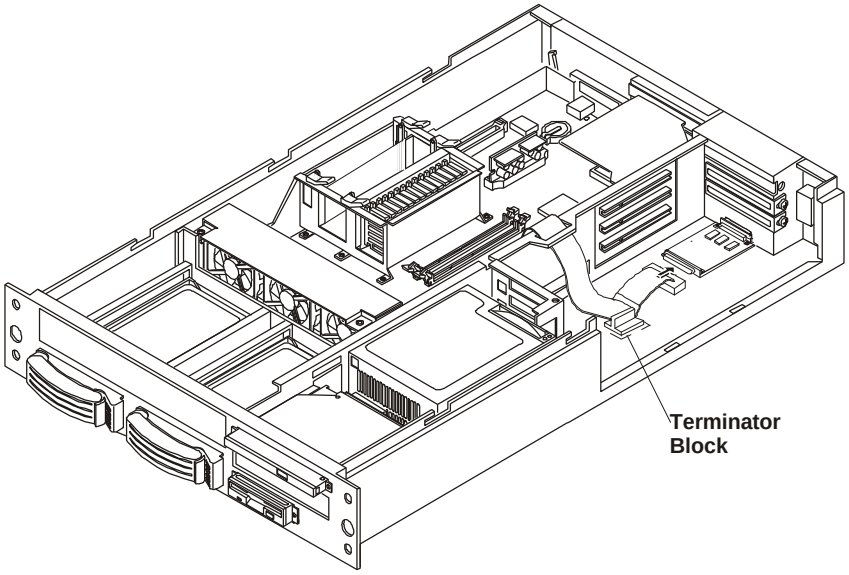


NOTE If there are other SCSI controllers on the PCI bus, the slot will affect boot order. See the Boot Device Priority.



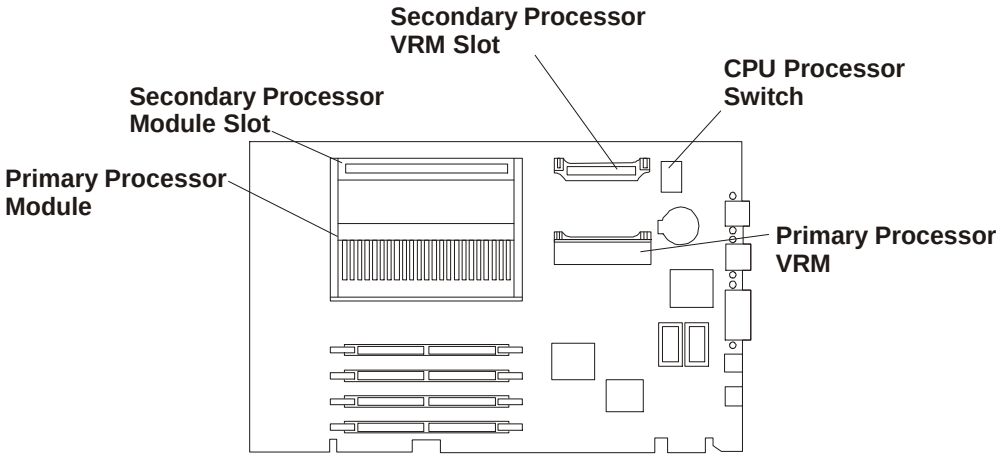


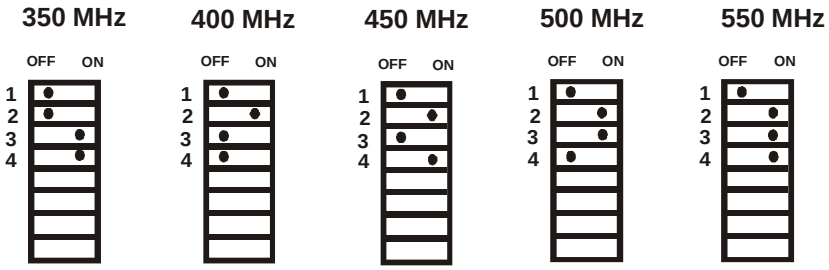




Processor Module

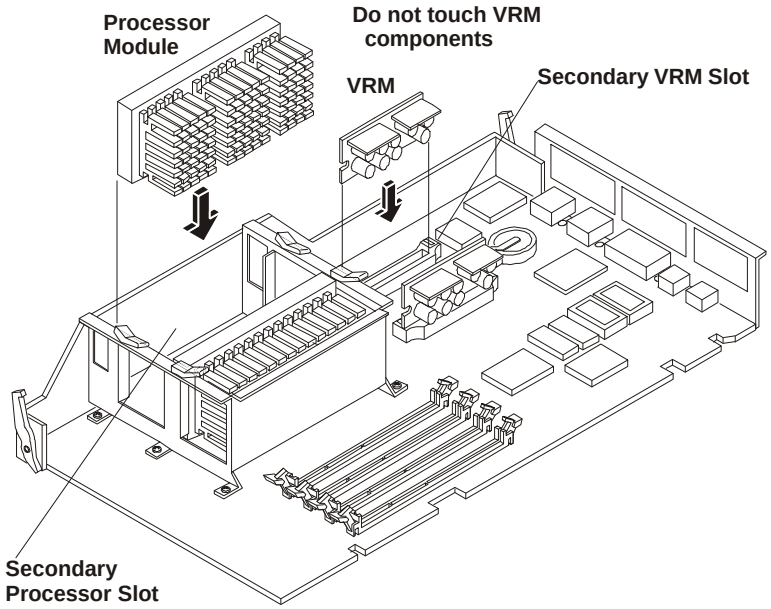
NOTE Be sure that the VRM and the processor module associated with it are both in primary or secondary slots. New processors are added. See the Technical Reference Card for the latest switch settings.





NOTE: Only the first 4 switches set the processor clock.

NOTE If you have two modules in your system with different clock rates, the switch setting must be for the lower of the two.



NOTE	Be sure that the VRM and the processor module associated with it are both in primary or secondary slots.

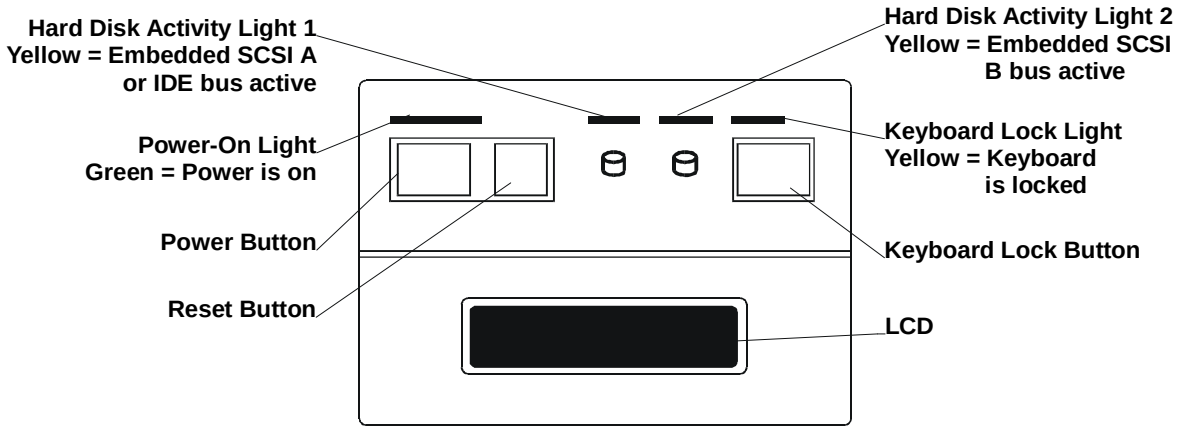
Control Panel Description

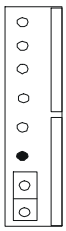


Power Button	Turns the NetServer on and off. Note that when the NetServer is turned off, the power to the internal circuitry and mass storage devices is disabled; however, AC power is still applied to the power supply. **Always disconnect the power cord before removing the cover.**
Power-On Light	Turns green when the NetServer is on.
Reset Button	Restarts the NetServer. You can press this button if the NetServer "hangs" or "locks up"—it has the same effect as turning the NetServer off and on. Save any work before pressing the reset button. Any information not saved is lost when the NetServer resets.
Hard Disk Activity Light 1	Yellow indicates activity on the Embedded SCSI A bus or IDE bus.
Hard Disk Activity Light 2	Yellow indicates activity on the Embedded SCSI B bus.
Keyboard Lock Button	Prevents unauthorized use of the keyboard. Press the keyboard lock button to lock the keyboard. Enter the password to unlock the keyboard.
Keyboard Lock Light	Turns yellow when the keyboard is locked.
LCD	Displays the Power-On Self-Test (POST) or system messages.

Control Panel Connector J1

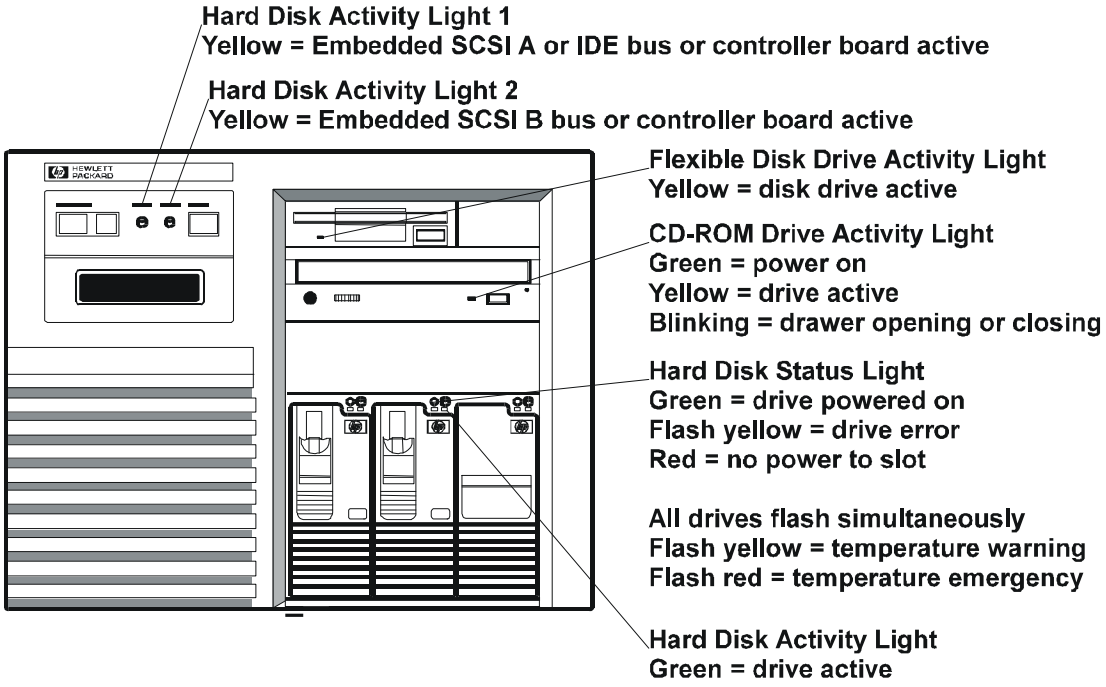
This connector is used by the HP Remote Assistant Accessory, a 32-bit EISA Bus Master board used to remotely monitor server functionality. For additional information on this product, see the documentation that comes with it. When you install the HP Remote Assistant cable, you will need to remove the jumper on **PS REMOTE** and **PS ON**. If you remove HP Remote Assistant from the server, remember to re-install the jumper.

WARNING	If the HP Remote Assistant is not installed and there is no jumper on PS REMOTE and PS ON, the system will **NOT** power up.

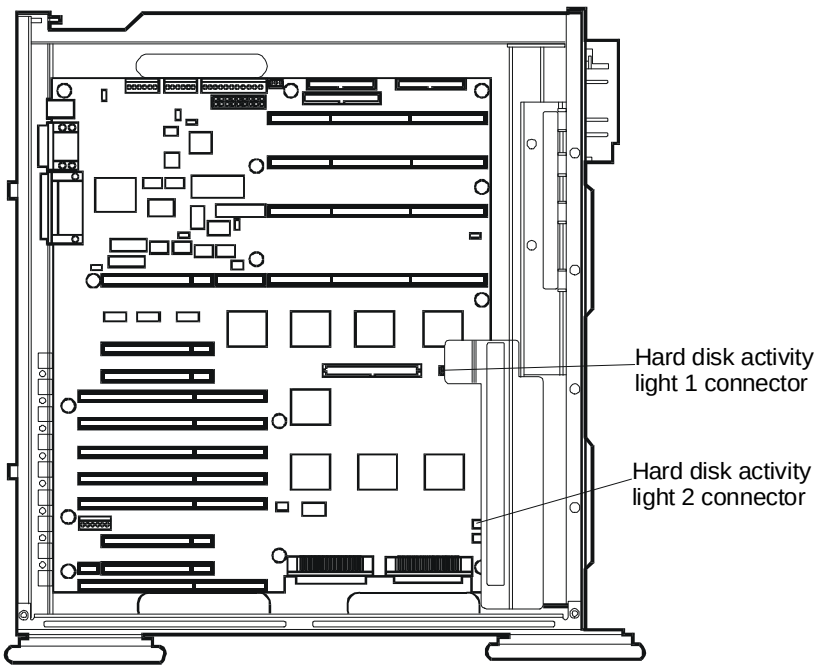


Control Panel J1

Mass Storage Indicator Lights



For some SCSI controller boards, you must connect the hard disk activity light.



Cover

CAUTION	The cover is an integral part of the NetServer. The NetServer must be operated with the cover in place to ensure proper airflow for continued reliability and to maintain compliance with radio frequency interference and safety standards.

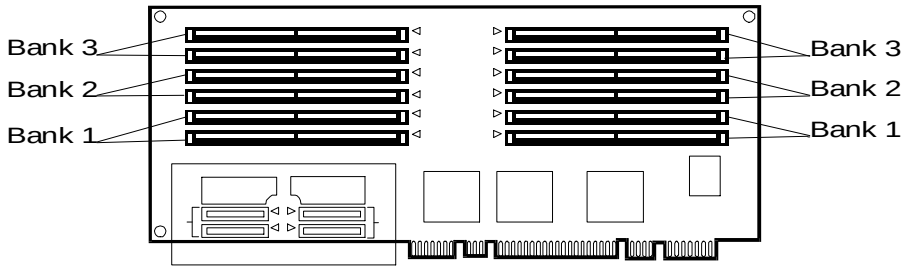
Switch/ Jumper	Description	Default
J9B1	Floppy Drive 1	Not used
J9C1	Floppy Drive 0	Not used
J9C3	**Power Control** - Disables or enables real-time clock power control. This jumper enables power supply maintenance voltage control using the real-time clock.	Disabled
J7D2	**Boot Block** (BIOS Recovery) - The flash memory contains a protected area that cannot be corrupted. Code in this area is used to boot the server from drive A if the BIOS gets corrupted during a BIOS update procedure. Enable this switch to use boot block recovery, then redo the BIOS update.	Disabled
J4H1	TDV	Not used
J6A1	**Video Sleep** - Determines which I/O port the onboard Cirrus Logic super VGA controller uses for its internal AT mode setup port.	REG 3C3
J7C1	**Program Boot Block** - lets a qualified service technician update the boot block.	Disabled

Switch/ Jumper	Description	Default
S8C1	Configuration Switches **- Switch S8C1**  **CMOS Clea**r: Setting this switch to ON clears CMOS and set the real-time clock (RTC) to the manufacturing defaults. **Password Clear**: Setting this switch to ON clears the password when the system reboots. Set to OFF to re-enter the password. **Flash Enable**: Setting this switch to ON lets the user update the contents of flash memory (BIOS) with the HPUpdate Utility.	ON OFF - default ON OFF - Default ON - Default OFF

Memory Configuration

Each ECC memory board has 12 SIMM sockets supporting 2 MB-32 MB, 70 ns or faster approved, fast-page parity SIMMs. You can install any size SIMM in any bank; however, all four SIMMs within a bank must be the same size.



When installing additional memory, note the following:

- The following HP SIMMs are supported:

Type	Product Number
4 MB SIMM (70 ns)	D2974A
8 MB SIMM (70 ns)	D3577A
16 MB SIMM (70 ns)	D2297A
32 MB SIMM (70 ns)	D3578A

- SIMMs must be installed in sets of four.
- SIMMs must be installed in sequential order starting with Bank 1.

Video Memory - DRAM

Video memory can be increased to 1 MB. The built in video subsystem comes with a Cirrus Controller with 512 KB of internal video memory. The internal, integrated Cirrus super VGA controller is fully compatible with these video standards: CGA, EGA, Hercules Graphics, MDA, and VGA. The standard system configuration comes with 512 KB of onboard video memory allowing pixel resolutions of 640 x 480 and 800 x 600 in 256 colors, and 1024 x 768 x 16 colors. The SVGA controller supports only analog monitors (single and multiple frequency, interlaced and noninterlaced) with a maximum vertical retrace interlaced frequency of 87 Hz.

Increasing the video memory buffer size to 1 MB with a 256 K x 16 (512 KB), 70 ns, 40-pin SOJ package DRAM allows the controller to support 132-column text modes and high resolution graphics.

Boot Device Priority

If you are installing a SCSI controller board, the priority of the controllers (where the BIOS will search for the boot drive) is set by the slot location where the board is installed. It is recommended that you install the boards in the lower slots to ease the routing of cables.

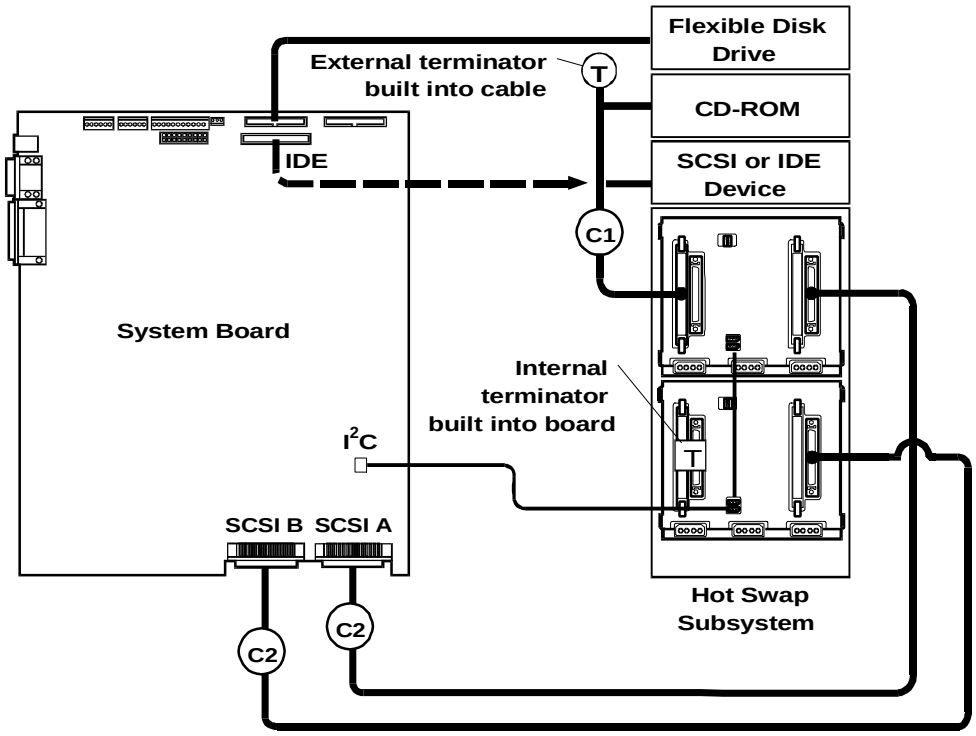
The following is the search path in order of the highest boot device priority:

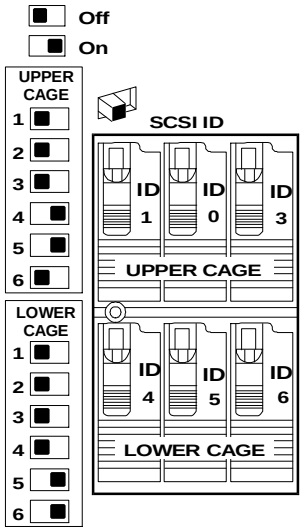
1. CD-ROM drive
2. Flexible disk drive
3. IDE device
4. All EISA and ISA slots
5. PCI 1 slot
6. PCI 2 slot
7. PCI 3 slot
8. PCI 4 slot
9. Embedded SCSI A controller
10. Embedded SCSI B controller
11. PCI 5 slot

Cabling

The hot swap subsystem comes in two standard models that can be reconfigured by changing the cables and switches located on the rear of the subsystem. You are not limited to these configurations, but they are given as possible examples.

Duplex, non-disk array model with internal controller (standard model)

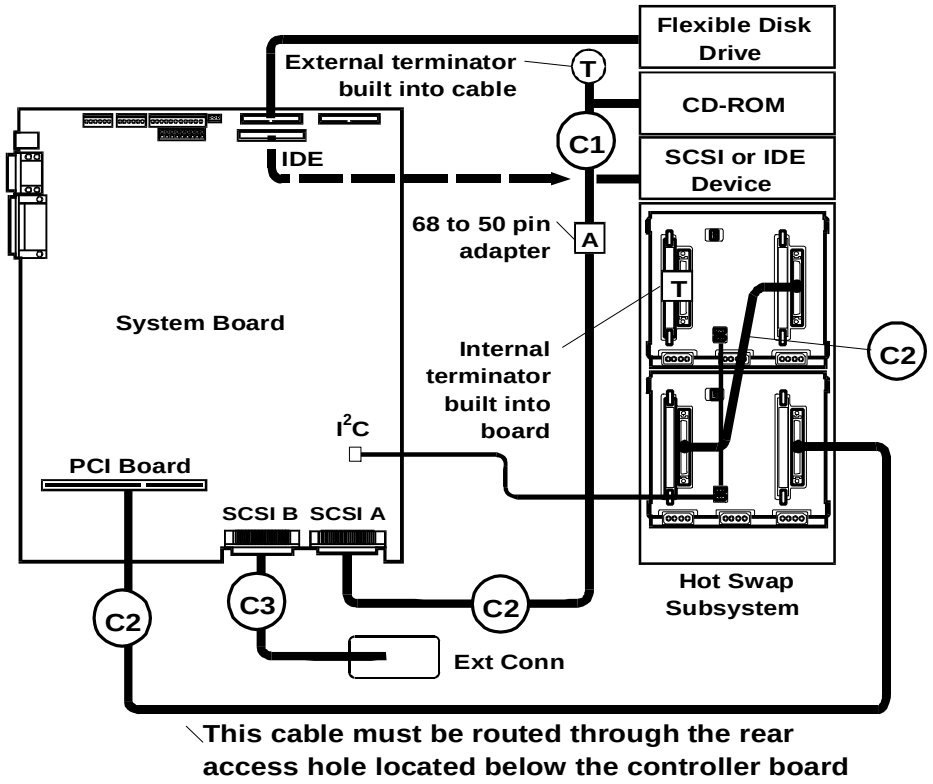


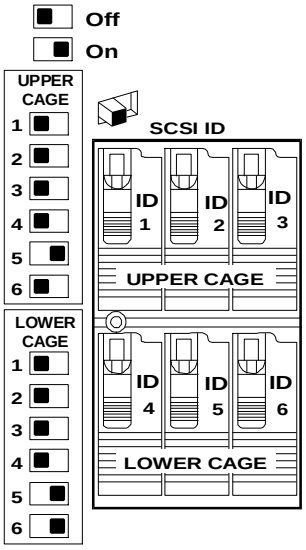


Default Switch Settings

These are the default SCSI address settings for this model. SCSI ID 2 is reserved for an added DAT (Digital Audio Tape) drive that can be installed in the upper horizontal Shelf 3. The CD-ROM drive is set for SCSI ID 5.

Non-duplex, disk array model with PCI controller board (standard model)



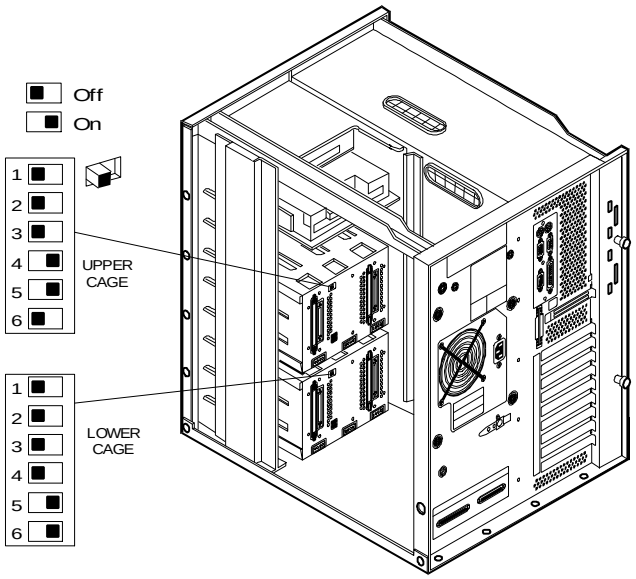


Default Switch Settings

These are the default SCSI settings that come with this model. The standard model includes a PCI controller board. The CD-ROM drive is set for SCSI ID 5. To change the SCSI addresses, see **Configuring Switch Settings on the Hot Swap Subsystem**.

Configuring Switch Settings on the Hot Swap Subsystem

Switches 3, 4 and 6 determine the SCSI address of the shelf.



The switch 6 setting determines upper and lower cage functionality. Switches 1 and 2 are always set to Off.

Switch	Function	Settings
1	**I^2C Bus Setting**	Always set to **Off**
2	**I^2C Bus Setting**	Always set to **Off**
3	**High/Low Addresses** Fast-Wide (68 pin) SCSI Only Sets SCSI addresses for upper or power eight addresses	**On** Sets drives to upper eight SCSI addresses. **Note:** this setting may cause time-out problems with your NOS due to delayed start. **Off** Sets drives to lower eight SCSI addresses.
4	**SCSI Address Zero** Sets middle shelf in cage to SCSI ID 0 or ID 8. ID number depends on the setting of switch 3.	**On** Sets middle shelf in the cage (shelf 2 or shelf 5) to SCSI ID 0 or ID 8. **Off** Sets middle shelf to normal SCSI address sequence.
5	**Remote Start** Determines control of the hot swap disk module power-on sequence.	**On** Internal control: Upper cage is set to delayed start, and lower cage is set to power-on at startup. **Off** Power-on sequence is determined by the disk array controller. **Not supported by HP SCSI controller boards.**
6	**Upper/Lower Cage** Identifies cage location. This is important information for the SCSI addresses and for the I^2C bus.	**On** Lower cage **Off** Upper cage

Hot Swap Subsystem SCSI Address Settings

Switches 3, 4, and 6 determine the SCSI address setting for each shelf in the hot swap subsystem. The following table describes the settings and the resulting shelf SCSI address.

NOTE For information on changing the SCSI address setting on the CD-ROM drive, see the Technical Information Label on the CD-ROM drive.

Upper Cage		Lower Cage	
Switch Settings	**SCSI Address**	**Switch Settings**	**SCSI Address**
3 - Off 4 - Off 6 - Off	Shelf 1 = ID 1 Shelf 2 = ID 2 Shelf 3 = ID 3	3 - Off 4 - Off 6 - On	Shelf 4 = ID 4 Shelf 5 = ID 5 Shelf 6 = ID 6
3 - Off 4 - On 6 - Off	Shelf 1 = ID 1 Shelf 2 = ID 0 Shelf 3 = ID 3	3 - Off 4 - On 6 - On	Shelf 4 = ID 4 Shelf 5 = ID 0 Shelf 6 = ID 6
3 - On 4 - Off 6 - Off	Shelf 1 = ID 9 Shelf 2 = ID 10 Shelf 3 = ID 11	3 - On 4 - Off 6 - On	Shelf 4 = ID 12 Shelf 5 = ID 13 Shelf 6 = ID 14
3 - On 4 - On 6 - Off	Shelf 1 = ID 9 Shelf 2 = ID 8 Shelf 3 = ID 11	3 - On 4 - On 6 - On	Shelf 4 = ID 12 Shelf 5 = ID 8 Shelf 6 = ID 14

Specifications

Power Supply	Auto-ranging 90 to 135 VAC, or 180 to 265 VAC at 50-60Hz
Power Availability	470W continuous, 530W peak
Power Consumption	723W maximum with 110/220V supply 815W peak with 110/220V supply
System Dimensions	19.3 in. high x 13.7 in wide x 18.1 in deep (49 cm high x 34.8 cm wide x 46 cm deep)
System Weight	50-70 lbs (22.7-31.8 kg), depending on configuration
Operating Temperature	41 to 95 degrees F (5 to 35 degrees C)
Operating Humidity	20% to 80% non-condensing
